

# Draft Environmental Impact Statement

Corporate Average Fuel Economy Standards for Passenger Cars and Light Trucks, Model Years 2027–2032, and Fuel Efficiency Standards for Heavy-Duty Pickup Trucks and Vans, Model Years 2030–2035

Appendices

July 2023

U.S. Department of Transportation  
**National Highway Traffic Safety  
Administration**

## **APPENDIX A**

### **Modeling Results Reported Separately by Vehicle Class**

## A.1 Energy – Fuel Consumption Impacts Reported Separately for Passenger Cars and Light Trucks, and Heavy-Duty Pickup Trucks and Vans

**Table A-1. Fuel Consumption and Decrease in Fuel Consumption by CAFE Standards Alternative (billion gasoline gallon equivalent total for calendar years 2022–2050)**

	No-Action	PC1LT3	PC2LT4	PC3LT5	PC6LT8
<b>Fuel Consumption</b>					
Cars	804	797	796	793	767
Light trucks	1,957	1,947	1,932	1,895	1,782
All light-duty vehicles	2,761	2,744	2,727	2,688	2,548
<b>Decrease in Fuel Use Compared to the No-Action Alternative</b>					
Cars		-7	-8	-11	-37
Light trucks		-9	-25	-62	-175
All light-duty vehicles		-17	-34	-73	-212

Notes: CAFE = Corporate Average Fuel Economy

**Table A-2. Fuel Consumption and Decrease in Fuel Consumption by HDPUV FE Standards Alternative (billion gasoline gallon equivalent total for calendar years 2022–2050)**

	No-Action	HDPUV4	HDPUV10	HDPUV14
<b>Fuel Consumption</b>				
HDPUVs	412.2	412.1	410.3	403.3
<b>Decrease in Fuel Use Compared to the No-Action Alternative</b>				
HDPUVs		-0.1	-1.9	-8.9

Notes: HDPUV = heavy-duty pickup trucks and vans; FE = fuel efficiency

**Table A-3. Fuel Consumption and Decrease in Fuel Consumption Cumulative Impacts of CAFE Standards and HDPUV FE Standards Alternatives (billion gasoline gallon equivalent total for calendar years 2022–2050)**

	No-Action	PC1LT3 + HDPUV4	PC2LT4 + HDPUV10	PC6LT8 + HDPUV14
<b>Fuel Consumption</b>				
LD Vehicles + HDPUVs	3,173.1	3,156.1	3,137.6	2,951.8
<b>Decrease in Fuel Use Compared to the No-Action Alternative</b>				
LD Vehicles + HDPUVs		-17.0	-35.5	-221.3

Notes: CAFE = Corporate Average Fuel Economy; HDPUV = heavy-duty pickup trucks and vans; FE = fuel efficiency

### A.3 Air Quality – Nationwide Emissions Impacts Reported Separately for Passenger Cars and Light Trucks, and Heavy-Duty Pickup Trucks and Vans

Table A-4. Nationwide Criteria Pollutant Emissions (tons per year) in 2035 from Passenger Cars and Light Trucks by Emissions Component and Alternative, Direct and Indirect Impacts

Emissions Component	No-Action	PC1LT3	PC2LT4	PC3LT5	PC6LT8
<b>Carbon monoxide (CO)</b>					
Cars tailpipe	2,056,457	2,046,328	2,049,142	2,040,652	2,006,512
Cars upstream	24,305	24,504	24,435	24,724	25,778
Trucks tailpipe	3,713,889	3,694,404	3,676,015	3,637,750	3,517,890

CO<sub>2</sub> = carbon dioxide; °C = degrees Celsius; ppm = parts per million; cm = centimeters; SSP = Shared Socioeconomic Pathway

Tables showing CO<sub>2</sub> emissions and GHG emissions reductions (MMTCO<sub>2</sub>) from the separate vehicle categories (passenger cars, light trucks, and HDPUVs) for purposes of the EIS’s cumulative impacts analysis are not presented here because this information was already presented in Chapter 5, Section 5.4.1, *Direct and Indirect Impacts on Greenhouse Gas Emissions and Climate Change* (Tables 5.4.1-1 through 5.4.1-4). CO<sub>2</sub> emissions and emissions reductions do not change between direct and indirect and cumulative impacts because they are not affected by the modeling reference scenario.

## **APPENDIX B**

### **Scoping Comments**

## **APPENDIX B SCOPING COMMENTS**

### **B.1 Introduction**

This appendix provides a synopsis of the substantive issues raised by public commenters in response to NHTSA’s Notice of Intent to Prepare an EIS. NHTSA received 20 public comments on the Notice of Intent. Scoping comments were received from four original equipment manufacturers (Cummins, Inc. [Cummins]; Rivian Automotive, LLC [Rivian]; Hyundai Motor America [Hyundai]; and Tesla, Inc. [Tesla]) and four trade associations (American Petroleum Institute, Growth Energy, Zero Emission Transportation Association [ZETA], and The Aluminum Association). In addition, NHTSA received scoping comments from two advocacy organizations: the Environmental Law & Policy Center and Sierra Club and Earthjustice (joint comment letter). Scoping comments were also received from state and local governments and Native American tribes: Pennsylvania Department of Transportation (PA DOT), State of Missouri Office of Administration, Office of the Oakland City Attorney, Mille Lacs Band of Ojibwe, and Southern Ute Indian Tribe. Finally, NHTSA received five scoping comments from private citizens.

The issues most frequently raised by the submissions included the range of alternatives; technology that could be applied in response to maximum feasible standards; and the air quality, health, climate, and economic impacts of the proposed standards. Frequently included within these comments were references to the scientific literature and other information supporting or supplementing their comments. NHTSA has carefully reviewed the comments and has considered them during preparation of the EIS.

### **B.2 Summary of Issues Raised by Commenters**

#### **B.2.1 Purpose and Need**

Three commenters—the Environmental Law & Policy Center, Tesla, and Sierra Club and Earthjustice (in a joint letter)—emphasized the need for NHTSA to prioritize energy conservation. The Environmental Law & Policy Center commented that NHTSA should place a strong weight on energy conservation, environmental considerations, and human health in accordance with the statutory command set out in the Energy Policy and Conservation Act (EPCA). Tesla further supported the prioritization of EPCA’s overarching purpose of energy conservation. Sierra Club and Earthjustice commented that NHTSA’s purpose and need must prioritize energy conservation above other considerations, also citing EPCA text related to maximum feasible fuel economy and EPCA’s four statutory factors. The commenter cited court cases in stating that no factor can override the need to conserve energy and that issues related to energy conservation—consumer cost, national balance of payments, environmental issues, and foreign policy considerations—should also be addressed. The commenter substantiated this position by citing studies and figures on U.S. petroleum consumption, especially in the transportation sector and projections of continued imports of petroleum.

Furthermore, Sierra Club and Earthjustice wrote that the technological feasibility factor should be read to be technology forcing and that the economic practicability factor should not bar the imposition of substantial costs or be tied to the needs of a single manufacturer, citing cases and a prior NHTSA statement. Finally, these joint commenters urged NHTSA to explicitly recognize that EPA’s greenhouse gas (GHG) standards are included as “other motor vehicle standards of the Government”, as well as those of California and other states.

Cummins addressed NHTSA’s fuel efficiency (FE) standards for medium- and heavy-duty (MDHD) engines and vehicles. The commenter stated their support for “tough, clear, and enforceable” standards. Cummins mentioned the need for collaboration between NHTSA, EPA, and “diverse stakeholders” throughout the process to set fuel economy standards. Cummins stated that there should be a harmonized national program for fuel efficiency and GHG standards by NHTSA, EPA, and the California Air Resources Board (CARB).

The Aluminum Association urged NHTSA that continuing to increase the efficiency of mobility solutions consistent with the “maximum feasible” criteria will strengthen the United States’ competitive advantage in the evolving global vehicle marketplace.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA’s purpose and need for its proposed action is discussed in Chapter 1, Section 1.2, *Purpose and Need*. NHTSA discusses its balancing of EPCA statutory factors and how the agency considered “the need of the United States to conserve energy,” and more specifically environmental implications, in its decision to set maximum feasible standards further in the proposed rule preamble Section V.A.5.a.(4)(c). NHTSA has considered a wide range of technologies that improve fuel economy. NHTSA notes that the technological feasibility factor allows NHTSA to set standards that force the development and application of new fuel-efficient technologies. However, NHTSA’s standards are performance-based, and manufacturers can achieve those standards through a combination of technology and compliance solutions. For more information, see the proposed rule preamble, Section IV. NHTSA agrees with the comment that economic practicability should not be tied to one manufacturer. NHTSA discusses economic practicability in the proposed rule preamble, Section IV.

In developing its regulatory baseline, NHTSA’s CAFE and heavy-duty pickup trucks and vans (HDPUV) No-Action Alternatives account for California’s Advanced Clean Cars II and Advanced Clean Truck (ACT) programs. NHTSA and EPA rulemakings to revise the standards remain closely coordinated despite being issued as separate regulatory actions. Chapter 1, Section 1.4, *Cooperating Agencies*, of this EIS and Section III.B of the proposed rule preamble discuss NHTSA’s coordination with EPA in setting CAFE and HDPUV FE standards. EPA is a cooperating agency for this EIS and, as such, EPA was asked to review and comment on the Draft EIS prior to publication.

## **B.2.2 Proposed Action and Alternatives**

### ***B.2.2.1 Proposed Action***

Cummins commented that NHTSA should provide manufacturers with sufficient regulatory lead time and stability to allow fuel-efficient technologies to be developed and implemented. The commenter expressed concern that issuing a final rule for MY 2029 FE standards no later than July 2025 would not meet the minimum 4 full years of lead time required under the Energy Independence and Security Act of 2007.

NHTSA is proposing MY 2030–2035 FE standards for HDPUVs, which allows for sufficient lead time and regulatory stability for manufacturers when issuing new FE standards.

### ***B.2.2.2 No-Action Alternative and Baselines***

Five commenters—Tesla, Sierra Club and Earthjustice, the Environmental Law & Policy Center, Rivian, and an individual commenter—provided input on the No-Action Alternative and baselines. Tesla and

Sierra Club and Earthjustice expressed support for NHTSA’s decision to include CARB’s Advanced Clean Cars II program in the No-Action Alternative baseline. Similarly, these commenters supported NHTSA including CARB’s ACT program in the baseline of the No-Action Alternative, asserting that five states have adopted this California regulation and EPA is in the process of finalizing the grant of a waiver for the ACT program.

The Environmental Law & Policy Center and an individual commenter stated that the popularity of fuel-efficient vehicles (particularly electric vehicles [EVs]), and the pace at which manufacturers and the market are moving toward cleaner vehicles is rising, has historically been underestimated by NHTSA, and NHTSA should properly account for this in the baseline. The Environmental Law & Policy Center urged NHTSA to incorporate accurate baseline assumptions about the fuel efficiency of MY 2027 and beyond vehicles absent any strengthening of the standards, citing the Inflation Reduction Act (IRA) and Infrastructure Investment and Jobs Act (IIJA) as containing provisions intended to jumpstart the transition to clean vehicles. The individual commenter said that the United States recently passed a threshold of 5 percent of new vehicle sales being EVs and, after such a threshold has been passed, mass EV adoption has been shown in other countries, citing Norway as an example. Citing a source estimating that 50 percent of new vehicle sales could be EVs by 2035, the commenter reasoned that as the efficiency of vehicles rises, the baseline rises, which in turn should raise the maximum feasible standards. Rivian also stated that NHTSA should account for the IRA and incentives for EV adoption when setting standards. Sierra Club and Earthjustice advised NHTSA to account for the IRA’s impacts on future EV sales.

In developing its regulatory baseline, NHTSA’s CAFE and HDPUV No-Action Alternatives account for California’s Advanced Clean Cars II and ACT programs and incentives included in the IIJA and IRA. Unlike other technologies in the analysis, Congress placed specific limitations on how NHTSA considers EV fuel economy when setting CAFE standards.<sup>1</sup> For the EIS analysis, NHTSA does consider manufacturers building EVs in response to the standards for NHTSA to consider the actual environmental impacts of the action in the decision-making process, even though the agency does not consider alternative fuel vehicles, including EVs, in setting its standards.<sup>2</sup>

### ***B.2.2.3 Reasonable Range of Alternatives***

Seven commenters—Environmental Law & Policy Center, Hyundai, ZETA, Tesla, Sierra Club and Earthjustice, Rivian, and Mille Lacs Band of Ojibwe—provided input on the reasonable range of alternatives NHTSA should consider. The Environmental Law & Policy Center and an individual commenter urged NHTSA to examine a range of alternatives that includes protective standards that would help avert the worst impacts of climate change and reduce threats to human health from climate change, near-road vehicle pollution, fossil fuel extraction and refining, and environmental justice concerns. Hyundai encouraged NHTSA to consider alternatives that have a lower impact on, and in fact benefit, environmental justice communities. The Environmental Law & Policy Center implored NHTSA to place a strong weight on energy conservation, environmental considerations, and human health when determining the upper and lower bound for the EIS range of alternatives, reasoning that the transportation sector has surpassed the electricity sector as the leading source of U.S. emissions

---

<sup>1</sup> 49 U.S.C. 32902(h)(1), (2). In determining maximum feasible fuel economy levels, “the Secretary of Transportation—(1) may not consider the fuel economy of dedicated automobiles; [and] (2) shall consider dual fueled automobiles to be operated only on gasoline or diesel fuel.”

<sup>2</sup> 40 CFR 1500.1(a).

contributing to climate change (citing EPA's April 2021 GHG inventory). ZETA and an individual commenter encouraged NHTSA to establish the most stringent standards possible.

Tesla and the Environmental Law & Policy Center requested that NHTSA consider a range of alternatives that accounts for the rapid development and deployment of fuel-efficient technology, with Tesla citing the rapid pace of vehicle electrification specifically. Tesla remarked that NHTSA should consider how more stringent MY 2027 and beyond standards that facilitate the greater deployment of zero-emission vehicles (ZEVs) will contribute to reducing the nation's oil dependency. The Environmental Law & Policy Center remarked that the most ambitious alternative has potential to become feasible and economically viable by implementation of the new standards. The Environmental Law & Policy Center stressed that costs of transitioning to cleaner vehicles are vastly outweighed by the costs of failing to take seriously the statutory command to set "maximum feasible" standards that will help lessen the impacts of the climate crisis and prevent more public health harms. Further, speaking specifically on heavy-duty (HD) vehicles, Rivian requested that NHTSA account for electrification trends and assist in accelerating the pace of electrification through maximum feasible FE standards that reflect the contributions of electrification in the market.

Sierra Club and Earthjustice supported NHTSA's use of an upper-bound alternative to place greater weight on energy conservation and environmental considerations than economic practicability concerns but stated that even the lower-bound alternative must recognize EPCA's purpose of conserving energy. The commenter stated that NHTSA cannot select any stringency within the range presented because, the commenter wrote, EPCA requires NHTSA to prioritize energy conservation above all other factors. The commenter cited 2012 and 2022 CAFE regulatory documents in urging NHTSA to analyze an 8 to 10 percent annual increase as the upper-bound alternative. Mille Lacs Band of Ojibwe urged NHTSA to aggressively decarbonize the U.S. transportation sector by ensuring there is at a minimum a 10.0 percent annual average increase in fuel efficiency, with alternatives examining the feasibility of up to 25.0 percent annual average increase in fuel efficiency. Furthermore, Mille Lacs Band of Ojibwe stated that NHTSA should require all newly produced light-duty (LD) vehicles to be zero-tailpipe emissions by no later than MY 2030 and HD vehicles no later than MY 2035.

Tesla asserted that NHTSA should consider a Preferred Alternative that sets the fuel economy standards stringent enough to result in vehicle deployment that substantially exceeds the 50 percent EV sales by 2030 goal established in President Biden's Executive Order (E.O.) 14037, reasoning that the E.O. was issued prior to the adoption of the IRA, IIJA, CARB's Advanced Clean Cars II program, and other new industry analyses and announcements. This commenter said that, in defining the Preferred Alternative, NHTSA must focus on the EPCA requirement that standards reflect a maximum feasible level and prioritize EPCA's overarching purpose of energy conservation. Therefore, according to Tesla, NHTSA must consider EPA's plans for MY 2027 and beyond LD GHG emissions standards, California's new ZEV standards, and the recently passed Federal legislation that is supportive of expansive vehicle electrification (i.e., IIJA and IRA).

Tesla commented that NHTSA should consider technology-forcing alternatives that account for rapid technological advances when reviewing potential alternatives. The commenter asserted that NHTSA should view "non-marketed prototypes" as technologically feasible, per *NRDC v. Herrington*, which the commenter said defined "technological feasibility" only as "capable of being carried out." Tesla urged for an evaluation of these technologically feasible, cutting-edge vehicle technologies to be reflected in alternatives. Furthermore, Tesla asserted that NHTSA should analyze alternatives that would

substantially exceed the goals in E.O. 14037 (50 percent EV sales by 2030), especially in recognition of the subsequent passage of IIJA and IRA.

NHTSA has reviewed and considered these comments in the development of this EIS. Chapter 2, *Proposed Action and Alternatives and Analysis Methods*, of this EIS and Section III of the proposed rule preamble address the selection of alternatives and the technologies that are anticipated to be feasible in the timeframe of this rulemaking. NHTSA addresses the limits of its statutory authority in the notice of proposed rulemaking (NPRM).

### **B.2.3 Environmental Impacts**

Sierra Club and Earthjustice generally commented that NHTSA must fully consider expected direct, indirect, and cumulative environmental impacts, citing regulations and caselaw. The commenter stated that NHTSA could improve its EIS by utilizing quantifiable, cost-based measures for environmental impacts in the EIS in addition to the risk impact assessment. Additionally, the commenter urged that any new EIS directly include all relevant information and tables provided in prior EISs instead of providing those materials in appendices. Furthermore, the commenter urged that NHTSA rely on up-to-date science in its analysis rather than simply incorporating prior analyses by reference.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA's EIS incorporates updated scientific methods and literature into its analysis of the potential environmental impacts of NHTSA's Proposed Action and alternatives. Regarding cost-based measures of environmental impacts, NHTSA presents the estimated monetized impacts of its proposed standards and regulatory alternatives in the Preliminary Regulatory Impact Analysis (PRIA).

#### **B.2.3.1 Energy**

Four commenters—the Environmental Law & Policy Center, Mille Lacs Band of Ojibwe, Tesla, and an individual commenter—addressed the energy-related environmental impacts of NHTSA's proposed rule. The Environmental Law & Policy Center discussed the impacts of NHTSA's proposed action as it relates to national energy security. The commenter expressed that encouraging the move to more fuel-efficient vehicles will protect the United States' economy and energy security. The commenter added that consumers are demanding more efficient cars following gas price hikes and concerns over the international oil market.

The Mille Lacs Band of Ojibwe stated that NHTSA's EIS must analyze and discuss land use impacts from the changes in mining and energy extraction, including impacts resulting from a transition from internal combustion engine (ICE) vehicles to EVs. The commenter also suggested that the EIS analyze land use impacts from scrapping (recycling or disposing) old vehicles due to the replacement of newer vehicles. An individual commenter also noted that NHTSA should consider the strength of EV adoption in the EIS.

Similarly, an individual commenter recommended that NHTSA's EIS should estimate the aggregate environmental and human health impacts caused by emissions, changes in land use, contamination, and other factors related to increased mining for EV-related resources, which the commenter said would be a reasonably foreseeable indirect effect of NHTSA setting high fuel economy standards. For example, this commenter stated that gold, lithium, and antimony would be minerals that would be mined due to the increased need for EVs in compliance with CAFE standards. The commenter suggested looking at the aggregate carbon emissions associated with extracting these minerals and asserted that antimony is poisonous and carcinogenic to humans. Additionally, the commenter stated that over-extraction and

pollution degrade environmental and human health, with consequences for the economic feasibility of the CAFE and FE standards.

Tesla generally recommended that NHTSA's EIS recognize the oil savings, emissions reductions, and public health and welfare benefits that will accrue from establishing stringent CAFE standards for MY 2027 and beyond and HDPUV FE standards for MY 2029 and beyond. Asserting that the harms caused by air pollution are necessarily cumulative, the Environmental Law & Policy Center urged NHTSA to fully account for the impacts on communities affected by oil extraction and oil refining.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA addresses potential environmental impacts of petroleum imports in Chapter 3, Section 3.2, *Affected Environment*, and discusses energy security in Chapter 6.2.4 of the Technical Support Document (TSD). In response to comments on land use impacts, NHTSA added discussions on interactions between land use and GHG life-cycle emissions (including from mining) (Chapter 3, Section 3.2.1.1, *Petroleum Extraction*) and land use tradeoffs between biofuel production and crop production (Chapter 3, Section 3.2.3, *Diesel and Biofuels*). Additionally, the EIS presents the environmental impacts from various criteria pollutants emitted during the energy production lifecycle (Chapter 4, *Air Quality*).

### **Energy Sources**

Four commenters—ZETA, Sierra Club and Earth Justice, Growth Energy, and an individual commenter—addressed how vehicle energy sources can affect the life-cycle emissions of vehicles.

ZETA encouraged NHTSA to consider how improvements in the U.S. electric grid will continue to lower the life-cycle emissions associated with EVs while the footprint associated with ICE vehicles would remain mostly unchanged. ZETA referred to a Wood Mackenzie study that the commenter asserted found that at typical mid-sized EV generates 67 percent fewer GHG emissions compared to lifetime emissions of ICE vehicles.

Sierra Club and Earthjustice stated that NHTSA must consider upstream impacts of oil spills from pipelines, environmental concerns associated with the transportation of crude oil in railcars, transport of oil sands crude, and updated information on methane releases and leaks from oil and gas extraction in its analysis of internal ICE vehicles. This commenter generally stated that NHTSA's life-cycle assessment (LCA) should be improved upon from its evaluation in the most recent Final EIS, and the EIS must include the full impacts for the transportation segment when assessing the adverse environmental impacts of ICE vehicles.

Growth Energy commented on energy sources such as bioethanol fuels. Growth Energy suggested that NHTSA evaluate the benefits of bioethanol while establishing fuel economy standards. Growth Energy cited research to support its assertion that there are air quality benefits and GHG reductions associated with bioethanol fuels. Growth Energy also referred to its comments on previous rules and urged NHTSA to consider these comments in detail. An individual commenter also provided feedback on biofuels and urged NHTSA to focus on zero tailpipe emissions and not pursue biofuels.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA analyzed and added discussions on electric grid projections and their potential impact on LCA emissions (Chapter 3, Section 3.2.2, *Electricity*). NHTSA expanded discussions on the environmental impacts of oil spills that may occur during petroleum transportation (Chapter 3, Section 3.2.1.2, *Petroleum Transportation*). NHTSA considers projections of biofuels and ethanol, their relative carbon intensity, and their

environmental risk associated with changing land use patterns (Chapter 3, Section 3.2.3, *Diesel and Biofuels*).

### **B.2.3.2 Air Quality**

Six commenters addressed air quality topics in their comments, which are summarized in the subsections below. NHTSA discusses the air quality impacts of its Proposed Action and alternatives in Chapter 4, *Air Quality*.

#### **Support for Electrification to Improve Air Quality**

Three commenters—Tesla, PA DOT, and ZETA—concluded that transitioning from ICE vehicles to EVs would improve air quality and lower risks of respiratory illnesses. Tesla urged NHTSA to assess how fuel economy standards promoting accelerated electrification would benefit public health, citing several peer-reviewed analyses it urged NHTSA to consider during development of the EIS.

NHTSA has reviewed and considered these comments in the development of this EIS. While NHTSA's standards do not require any particular technology solution, NHTSA's analysis of the air quality impacts of the Proposed Action and alternatives in Chapter 4, *Air Quality*, shows how the No-Action Alternative and action alternatives would impact nationwide emissions of criteria and toxic air pollutants, including health effects.

#### **Requests for Air Quality Analysis**

Six commenters—the Environmental Law & Policy Center, Cummins, Southern Ute Indian Tribe, PA DOT, ZETA, and Tesla—requested NHTSA consider specific analyses of air quality topics. The Environmental Law & Policy Center recommended that NHTSA examine the effects of reduced emissions of ozone precursors, nitrogen oxides, and particulate matter, which the commenter asserted trigger chronic health problems and emergency room visits for sensitive populations. Cummins also recommended that the tradeoff between nitrogen oxides and carbon dioxide reductions must be considered when setting the stringency of FE standards. The Southern Ute Indian Tribe requested additional information about how methane seepage and vehicle emissions will affect air quality and the atmosphere, particularly in the Southwest. PA DOT requested that NHTSA consider how changes in air quality resulting from the rule would affect metropolitan planning organizations' air quality goals and air quality conformity determinations for transportation improvement programs. ZETA provided a reference for NHTSA to include studies on near-road emissions and health effects. Tesla provided studies highlighting the environmental benefits of light duty standards that result in significantly greater deployment of EVs that result in reduced emissions.

Tesla generally recommended that NHTSA's EIS recognize the oil savings, emissions reductions, and public health and welfare benefits that will accrue from establishing stringent CAFE standards for MY 2027 and beyond and HDPUV FE standards for MY 2029 and beyond. Asserting that the harms caused by air pollution are necessarily cumulative, the Environmental Law & Policy Center urged NHTSA to fully account for the impacts on communities affected by near-road pollution.

NHTSA has considered these comments in its development of this EIS. As suggested by the Environmental Law & Policy Center, the EIS does evaluate how the Proposed Action and alternatives would affect health outcomes (Chapter 4, Section 4.2.1.1, *CAFE Standards – Health Impacts*; Section 4.2.1.2, *HDPUV FE Standards – Health Impacts*; Section 4.2.2.1, *Cumulative Impacts of MY 2027–2032*

*CAFE Standards and MY 2030–2035 HDPUV FE Standards – Health Impacts*). In its scoping notice, NHTSA announced that it would include full-scale photochemical air quality modeling to estimate changes in ambient levels of air pollutants and their associated impacts on human health and welfare for the Final EIS.

NHTSA considered the tradeoffs among air pollutants and GHGs in balancing its statutory factors and considerations in setting the CAFE standards and HDPUV FE standards. Chapter 4, Table 4.2.1 4, *Maximum Changes in Criteria Pollutant Emissions (tons per year) from U.S. Passenger Cars and Light Trucks, Across All Nonattainment or Maintenance Areas, Alternatives, and Years, Direct and Indirect Impacts*, provides estimated emissions changes by nonattainment area, which can inform metropolitan planning organizations' air quality programs. As noted by Tesla and the Environmental Law & Policy Center, near-road air quality impacts are of concern. While a local analysis (i.e., at the individual roadway level) is impractical for a nationwide EIS, NHTSA believes that the regional emissions analysis provided in Chapter 4, *Air Quality*, still provides valuable information and is feasible for the scope of this analysis. Emissions changes due to the rebound effect would occur from LD vehicles and HDPUVs operating on entire regional roadway networks; any emissions changes due to the rebound effect would be distributed throughout a region's entire road network and at any specific location would be uniformly proportional to VMT changes at that location. At any one location within a regional network, the resulting change in emissions would be small compared to total emissions from all sources surrounding that location (including existing emissions from traffic already using the road), so the localized impacts of the Proposed Action and alternatives on ambient concentrations and health impacts should also be small. The nationwide aggregated consequences of such small near-road impacts on ambient pollutant concentrations and health might be larger but are not feasible to quantify. These topics raised by commenters are addressed throughout the EIS's analysis of how the Proposed Action and alternatives would affect air quality in Chapter 4, *Air Quality*.

### **B.2.3.3 Climate Change**

#### **Analysis Methods**

Four commenters—Environmental Law & Policy Center, PA DOT, Tesla, and ZETA—made suggestions relating to the EIS's analysis methods to assess the climate change impacts of NHTSA's Proposed Action. The Environmental Law & Policy Center requested that NHTSA qualitatively and quantitatively assess how new fuel economy standards are expected to affect climate warming, precipitation, and "other harmful effects" of climate change. The commenter added that NHTSA should communicate climate effects to the public in a way that facilitates public understanding, without diminishing the magnitude of these effects. The commenter noted that presenting the expected emissions reductions solely in the context of global emissions on a 100-year scale would unfairly diminish the magnitude of these effects, and suggested the Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report as illustrating the importance of climate change to the Midwest and Great Lakes. PA DOT also suggested that NHTSA consider IPCC's Sixth Assessment Report and recognize risks to ecosystems, human health, and economies. PA DOT urged NHTSA to weigh the negative impacts of lower standards. Tesla commented suggesting NHTSA consider the IPCC Sixth Assessment Report as well.

NHTSA has reviewed and considered these comments in the development of this EIS. In Chapter 5, *Greenhouse Gas Emissions and Climate Change*, NHTSA has considered a wide range of the potential environmental impacts of GHG emissions, including changes in global mean surface temperature and global precipitation. As suggested by commenters, the EIS's discussion of climate change impacts refers extensively to the IPCC Sixth Assessment Report (Chapter 5, *Greenhouse Gas Emissions and Climate*

*Change*; Appendix E, *Climate Change*). NHTSA presents climate impacts in 2040, 2060, and 2100, which helps demonstrate both the near-term (mid-century) and end-of-century impacts from the proposed alternatives. Emissions reductions by alternative are presented as a line chart from 2022 to 2050 in Chapter 5, Figure 5.4.1-3.

### **Social Cost of Carbon**

Two commenters—Tesla and Sierra Club and Earthjustice—addressed the social cost of carbon in their scoping comments. Tesla expressed support for NHTSA’s proposed use of the interim Federal social cost of carbon as a starting point for analysis. However, Tesla cited numerous studies to support its argument that the interim social cost of carbon underestimates the actual costs and impacts of climate change. The commenter urged NHTSA to adjust their analysis to align with the literature cited.

Furthermore, Sierra Club and Earthjustice urged NHTSA to evaluate cumulative impacts by examining comparative data and utilizing Interagency Working Group’s most recent social cost of carbon figures in examining alternatives. The commenter cited National Oceanic and Atmospheric Administration research as supporting what the commenter described as the increasingly reliable science for quantifying climate change impacts.

NHTSA includes analysis of the monetized climate change benefits of increasing CAFE and FE standards in Chapter 8 of the PRIA, which is consistent with prior EISs associated with rulemakings for CAFE and FE standards. The discussion in the PRIA is incorporated by reference into Chapter 5, *Greenhouse Gas Emissions and Climate Change*, consistent with CEQ regulations.<sup>3</sup>

### **Cumulative Climate Change Impacts**

Four commenters—the Environmental Law & Policy Center, Tesla, a joint submission from the Sierra Club and Earthjustice, and ZETA—discussed the health, societal, and environmental impacts of climate change. All commenters remarked that NHTSA should address how transitioning to low- or zero-emission transportation would have significant health implications. Asserting that the harms caused by climate-changing and health-damaging air pollution are necessarily cumulative, the Environmental Law & Policy Center urged NHTSA to fully account for climate change impacts on communities affected by oil extraction, oil refining, and near-road pollution, as well as those communities “on the front lines of climate change impacts.”

Sierra Club and Earthjustice commented that NHTSA must evaluate and disclose the costs of any delay of increased standard stringency (i.e., “backloading” higher degrees of stringency into outer years), citing NHTSA’s 2012 Final EIS (NHTSA 2012) climate cumulative impacts discussion, which stated that “delaying mitigation of GHG emissions results in greater accumulation of CO<sub>2</sub> in the atmosphere, thereby increasing the risk of crossing tipping points and triggering abrupt changes.”

Sierra Club and Earthjustice commented that NHTSA must present cumulative impacts in a way to highlight their significance. In particular, the commenter wrote that NHTSA should consider scenarios under which world governments take aggressive action to address climate change. The commenter added that NHTSA should consider the current administration’s regulatory agenda and other legislative and regulatory actions being taken to address climate change, as well as IPCC report discussions of

---

<sup>3</sup> 40 CFR 1501.12.

climate change impacts. The commenter stated that contextualizing alternatives within a carbon budget will also better inform NHTSA's decision-making.

NHTSA has reviewed and considered these comments in the development of the EIS. This EIS analyzes the potential direct, indirect, and cumulative impacts of the Proposed Action and alternatives. NHTSA has considered the best available information and includes extensive analyses of the potential climate change impacts of the Proposed Action and alternatives in the PRIA and this EIS. Chapter 5, Section 5.4.2, *Cumulative Impacts on Greenhouse Gas Emissions and Climate Change*, examines the potential climate impacts resulting from the different alternatives under a moderate climate scenario, SSP2-4.5. This scenario assumes that there will be some level of successful global action taken to limit greenhouse gas emissions, although not as ambitious as scenarios with more dramatic CO<sub>2</sub> reductions. The SSP2-4.5 scenario takes into account various factors, including demographics, technology, energy consumption, and land use changes, to project future GHG emissions and climate impacts. The U.S. Federal regulatory and legislative agenda plays a role in shaping this moderate climate scenario. These programs are further detailed in Appendix E, Section E.4.2.4.3, *Other Past, Present, and Reasonably Foreseeable Future Actions*. This section provides an overview of the relevant policies and programs that have been implemented, are currently in place, or are likely to be enacted in the foreseeable future. Additionally, NHTSA has considered the GHG impacts of its fuel economy actions in terms of a global carbon budget in Chapter 5, Section 5.4.1.1, *Greenhouse Gas Emissions*.

#### **B.2.3.4 Life-Cycle Assessment Implications of Vehicle Materials**

Three commenters—Mille Lacs Band of Ojibwe, Cummins, and Aluminum Association, and American Petroleum Institute—discussed LCA implications of NHTSA's proposed rule. The Mille Lacs Band of Ojibwe commented on the topic of LCA broadly and requested that NHTSA conduct a complete LCA of the impacts of its proposed rule. The commenter recognized that quantifying the LCA impacts would require extensive data collection on many variables that are highly uncertain but urged NHTSA to collect as much relevant data as possible and insert best guesses based on past experiences. Cummins suggested that NHTSA consider well-to-wheels emissions and energy use in assessing technology effectiveness to ensure alignment of the standards with the most beneficial path to zero emissions.

The Aluminum Association expressed their interest in providing aluminum life-cycle inventory data, specifically developed for the automotive market, to be easily accessed and used by stakeholders with the latest data published in February 2022. The Aluminum Association recognized the ability for NHTSA and stakeholders to use the data to assess environmental impacts of aluminum auto products throughout the life cycle of vehicles.

The American Petroleum Institute urged NHTSA to consider a wells-to-wheels approach in setting standards as it provides a systems-based analytical framework to evaluate impacts.

NHTSA has considered these comments in developing the EIS. NHTSA has included detailed discussion of the LCA-related differences in emissions impacts associated with difference choices of vehicle energy sources (Chapter 3, *Energy*) and vehicle materials (Chapter 6, *Life-Cycle Assessment Implications of Vehicle Materials*) so that the decision-maker is informed about the impacts of different vehicle technology choices. As suggested by a commenter, Chapter 6, *Life-Cycle Assessment Implications of Vehicle Materials*, addresses the use of aluminum in vehicle manufacture specifically.

As explained in Chapter 6, Section 6.1, *Introduction*, a complete LCA of the impacts of a CAFE rulemaking, which is beyond the scope of an EIS, would require extensive data collection on many

variables that are highly uncertain, including future design and technology response of vehicle manufacturers to a given set of standards; an applied technology's manufacturing processes, application to vehicles, and disposal after use; interactions between applications of multiple fuel savings technologies; regional fuel sourcing projections and electric grid compositions; and data on the variety of vehicle types, manufacturers, and technology uses expected in the future. In this rulemaking, different regulatory alternatives (for both CAFE and HDPUV FE standards) are based on performance and the standards do not mandate the adoption of specific technologies. Therefore, NHTSA cannot know precisely how manufacturers will choose technologies to meet a particular regulatory alternative. For this reason, NHTSA does not believe that a complete LCA would be an accurate way for decision-makers to evaluate differences in impacts across action alternatives.

### **B.2.3.5 Environmental Justice**

#### **General Environmental Justice Comments**

Multiple commenters identified concerns with the potential environmental justice impacts from changes to the fuel economy standards. The Office of the Oakland City Attorney (Oakland City Attorney) commented that frontline and fenceline communities, particularly those in lower-income communities and communities of color, are disproportionately burdened by harmful effects of pollution related to health and well-being. The Oakland City Attorney requested that NHTSA apply an environmental justice lens to the impact analysis, specifically to analyze the range of alternatives considered for CAFE and FE standards. The Oakland City Attorney recommended that NHTSA pay particular attention to the impact of each alternative on frontline and fenceline communities that have historically suffered the most from vehicle emissions.

The Environmental Law & Policy Center stated that the harms caused by climate-changing, health-damaging pollution are cumulative and that NHTSA should account for the impacts on communities that are affected by oil extraction, refining, and near-road pollution. An individual commenter also encouraged NHTSA to take into consideration environmental justice.

Additionally, Hyundai encouraged NHTSA to, consistent with goals from prior E.O. and DOT policies, consider alternatives that would benefit environmental justice communities. Hyundai also urged NHTSA to fully analyze the impacts of alternatives without similar benefits to environmental justice communities. Further, Hyundai encouraged NHTSA to consider developing an optional program to provide credits or flexibilities to manufacturers who target higher fuel economy distribution in environmental justice communities. Hyundai stated that the EIS is a critical opportunity for NHTSA to consider environmental justice communities and the effect of its proposed action on such communities.

Sierra Club and Earthjustice commented that NHTSA's Final Supplemental EIS for MY 2024–2026 CAFE standards failed to identify studies on impacts on communities located near power generation, distribution facilities, or mining sites, but that EPA's 2015 NPRM stated that a higher percentage of communities of color and low-income communities live in proximity to power generation sites. Sierra Club and Earthjustice urged NHTSA to consider EPA's analyses in developing its own and provided a citation to a study regarding environmental justice and proximity to power generation sites. Sierra Club and Earthjustice also provided additional studies for NHTSA to consider.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA analyzes the potential environmental justice impacts of the Proposed Action and alternatives in Chapter 7, *Environmental Justice*. The two major policies guiding NHTSA's environmental justice analysis are E.O.

12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*,<sup>4</sup> and DOT Order 5610.2(a), *Department of Transportation Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*.<sup>5</sup> These policies require agencies to identify and consider any disproportionately high and adverse human health or environmental effects of a proposed action. NHTSA carefully considered all of the information and studies provided. As discussed in the Chapter 7, *Environmental Justice*, which includes some of the information provided by commenters, while there are likely to be some disproportionate adverse effects on low income and minority populations resulting from the Proposed Action, these impacts would be minor and are not considered “high” as defined by the E.O. and DOT Order. NHTSA’s proposed compliance flexibilities are addressed in Section VI.B of the preamble to the proposed rule.

### ***Effects of Mining and Resource Extraction***

Two commenters—Mille Lacs Band of Ojibwe and Sierra Club and Earthjustice—addressed the Proposed Action’s potential impacts on mining and resource extraction. The Mille Lacs Band of Ojibwe requested that the environmental justice section of the EIS discuss how mining and energy resource activities and impacts often occur within 35 miles of Indian country. Similarly, Sierra Club and Earthjustice provided a citation as to the percent of metals located within 35 miles of Indian reservations and urged NHTSA to consider studies on cultural impacts of mining on Native Americans.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA analyzes the potential environmental justice impacts of the Proposed Action and alternatives in Chapter 7, *Environmental Justice*. NHTSA has incorporated the study identified by commenters about mining sites for energy-transition metals being sited within 35 miles of Indian reservations Chapter 7, Section 7.2.3, *Proximity to Mining for Energy-Transition Resources*, and Section 7.3.1.3, *Proximity to Mining for Energy-Transition Resources*. This includes information about how proximity of mines could disproportionately affect Native American populations.

### ***Health Effects on Environmental Justice Communities***

Four commenters—Oakland City Attorney, the Environmental Law & Policy Center, Sierra Club and Earthjustice, and ZETA—addressed the health-related impacts of vehicle emissions on environmental justice communities. The Oakland City Attorney pointed out that health disparities by race are stark, indicating that policy changes would disproportionately benefit environmental justice populations. The Oakland City Attorney also expressed that West and East Oakland residents are prime examples of individuals who face severe health problems because of vehicle-related pollution and would disproportionately benefit from more aggressive FE standards. The Environmental Law & Policy Center suggested that NHTSA examine the effects of reduced emissions of ozone precursors, nitrogen oxides, and particulate matter. The commenter stated that these pollutants affect urban areas and trigger health problems and emergency visits for sensitive populations. Sierra Club and Earthjustice commented that air pollution disproportionately affects the health of minorities, lower-income and lower-educational-attainment individuals, and that NHTSA’s analysis of these impacts should

---

<sup>4</sup> Executive Order 12898; *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, 59 FR 7629 (Feb. 16, 1994).

<sup>5</sup> Department of Transportation Updated Environmental Justice Order 5610.2(a); Final DOT Environmental Justice Order, 77 FR 27534 (May 10, 2012).

incorporate more recent studies. ZETA cited research as indicating that minority communities experience greater nitrogen dioxide exposure and concomitant health risks.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA analyzes the potential environmental justice impacts of the Proposed Action and alternatives in Chapter 7, *Environmental Justice*. NHTSA has updated the environmental justice literature review to include several more recent studies identified by commenters as well as studies from similar recent rulemakings. These new studies cover topics related to disproportionate health impacts on communities located near industrial facilities (including power generation), roadways, and mining for energy-transition metals.

### **Equity**

Four commenters—Sierra Club and Earthjustice, Environmental Law & Policy Center, PA DOT, and an individual commenter—provided comments regarding more stringent standards be evaluated to promote environmental justice and equity. Sierra Club and Earthjustice stated that decreases in vehicle and upstream non-GHG gas emissions over time provide benefits to environmental justice populations. Additionally, they stated that NHTSA’s standards will decrease refinery emissions and benefit nearby communities, which are historically low-income and minority communities and that clean, more fuel-efficient vehicles will benefit these populations.

The Environmental Law & Policy Center suggested that NHTSA consider the environmental justice and equity impacts of reducing near-road pollution in environmental justice communities that are crossed by highways or near oil refineries.

A few commenters addressed equity for environmental justice populations as it relates to the potential impacts of NHTSA’s standards on vehicle prices. For example, PA DOT suggested that standards should be evaluated relative to the effect they may have on vehicle prices because, if vehicle prices are higher, areas with environmental justice populations may have fewer low-emission vehicles and, thus, worse air quality. In addition, PA DOT suggested that more stringent standards may also affect small or disadvantaged businesses if vehicles become more expensive. Additionally, an individual commenter suggested that NHTSA consider the price effect on both new and used passenger vehicles and HD trucks from the new standards. The commenter suggested the EIS consider the environmental justice and economic effects high prices may have because increased prices will have a disproportionate effect on environmental justice populations.

NHTSA has reviewed and considered these comments in the development of this EIS. NHTSA analyzes the potential environmental justice impacts of the Proposed Action and alternatives in Chapter 7, *Environmental Justice*. NHTSA has updated the environmental justice literature review to include several more recent studies identified by commenters as well as studies from similar recent rulemakings. These new studies cover topics related to disproportionate health impacts on communities located near industrial facilities (including power generation) and roadways, as well as distributed benefits of EVs amongst disadvantaged populations. NHTSA also considered a quantitative environmental justice analysis in accordance with analyses asked by commenters but decided that, given the uncertainties and constraints of the data and quantitative methods available, a qualitative literature review with updated studies was most appropriate for this EIS. NHTSA was unavailable to find peer-reviewed studies on the impact of vehicle prices on small or disadvantaged businesses and did not incorporate this topic into Chapter 7, *Environmental Justice*.

### **B.2.3.6 Historic and Cultural Resources**

The Mille Lacs Band of Ojibwe stated that the EIS must contain a historic and cultural resources section to conform with requirements in the National Historic Preservation Act of 1966 (NHPA) and the National Register of Historic Places. They expressed that the EIS must also discuss the possibility of degradation of cultural assets that are outlined in the Native American Graves Protection and Repatriation Act (NAGPRA). The Mille Lacs Band of Ojibwe stated that, while quantifying NAGPRA impacts may be difficult, some components, such as the analysis of intangible cultural assets, can be performed and discussed in the EIS historical and cultural resources section, as well as the environmental justice section.

Chapter 8, *Historic and Cultural Resources*, addresses the potential environmental impacts of NHTSA's Proposed Action and alternatives on historic and cultural resources. This chapter provides an overview of Federal historic preservation laws including NHPA and NAGPRA, among others. The chapter also discusses impacts to intangible cultural assets including sacred sites or objects that are of importance to Native American tribes. NHTSA addresses its obligations under Section 106 of NHPA in Section VIII.D.3 of the preamble to the proposed rule.

### **B.2.3.7 Other Environmental Impacts**

Two commenters—PA DOT and the Aluminum Association—addressed other environmental impacts of NHTSA's Proposed Action. PA DOT commented that they face challenges in understanding the financial, operation, and environmental impacts on EV and hybrid vehicles as they relate to crashes and failures. They also stated that there have been EV and autonomous vehicle impacts that have resulted in responders learning new processes and procedures for when failures to these types of vehicles occur. PA DOT and the Aluminum Association requested that NHTSA consider impacts related to crashes and failures for EVs. PA DOT expressed concern about potential impacts resulting from EV chargers, including buried electrical networks that need to be upgraded and expanded, which may cause additional damage to highways.

NHTSA has reviewed and considered these comments in the development of the EIS. As explained in Chapter 2, *Proposed Action and Alternatives and Analysis Methods*, NHTSA's analysis of the potential safety impacts on human health of the Proposed Action and alternatives is found in the NPRM and PRIA rulemaking documents. NHTSA addresses the potential safety-related impacts of the Proposed Action and alternatives in Section II.H of the NPRM preamble.

## **B.2.4 Mitigation**

The Mille Lacs Band of Ojibwe asserted that the EIS should include clear guidance to minimize or mitigate the impacts of mining and energy extraction on Native American tribes and Indigenous communities.

NHTSA has reviewed and considered these comments in the development of this EIS. The CEQ regulations implementing NEPA require NHTSA to include in an EIS a discussion of appropriate mitigation measures. Chapter 9, *Mitigation*, of the EIS discusses mitigation measures for impacts related to NHTSA's action of setting CAFE and HDPUV FE standards. As noted in Chapter 9, NHTSA does not have jurisdiction to regulate any increased mining activity that may indirectly result from NHTSA's proposed action, such as an increased demand for minerals required for EV battery manufacture.

## **B.2.5 Other Rulemaking Issues**

Several commenters expressed views about the MY 2027 and beyond CAFE standards and MY 2029 and beyond HDPUV FE standards that did not relate to the analysis of environmental impacts of those standards in the EIS. NHTSA has carefully considered these comments in developing its proposal. Issues raised by these commenters are addressed in NHTSA's NPRM, PRIA, and TSD.

Multiple commenters, including the Environmental Law & Policy Center, the Oakland City Attorney, ZETA, Hyundai, Tesla, and PA DOT, generally stated that CAFE and FE standards should help improve human health, provide environmental justice benefits, reduce GHG emissions, increase fuel savings, and facilitate fleet electrification.

Tesla encouraged NHTSA to set the standards at a level of stringency that would result in vehicle deployment that substantially exceeds the 50 percent EV sales by 2030 goal established in E.O. 14037. Rivian generally supported setting new standards, but the commenter urged NHTSA to take a new approach to standard setting to reflect current electrification trends in the industry. The commenter asserted that the FE standards for HDPUVs are not necessarily subject to the same statutory constraints as the CAFE standards. Additionally, the commenter stated that NHTSA should fully account for electrification in the HDPUV market when setting FE standards, while considering recently enacted Federal legislation meant to incentivize EV adoption. Rivian and ZETA argued that standards should be set as a multi-attribute function, with either the market share of ZEVs as a second attribute or a three-dimensional, multi-attribute function of both vehicle footprint and work share. ZETA reasoned that more stringent standards would incentivize manufacturers to produce more EVs instead of increasing the fuel efficiency of ICE vehicles.

The Aluminum Association supported the continued use of a footprint-based standard and asserted that such standards incentivize automakers to focus on fuel efficiency and emissions improvements across all vehicle classes through greater use of lighter, yet stronger materials.

Cummins suggested that the standards should be performance based, fuel neutral, and technology neutral, with no technology mandates, to allow manufacturers to innovate across a broad range of technologies to meet customers' needs. The commenter added that the FE standards should continue to consider a work factor attribute that considers payload capacity, towing capacity, and four-wheel-drive capability.

American Petroleum Institute suggested the use of a performance-based, fuel-neutral, and technology-neutral analytical system that links standards for carbon intensity of motor fuel with the requirements for new vehicle fuel economy to ensure consistent accounting across all fuel and vehicle technology options.

PA DOT commented on the need to consider other aspects of standard setting, including infrastructure upgrades to accommodate increased EV usage, effects on other transportation initiatives such as Moving Ahead for Progress in the 21st Century (MAP-21) performance measures and the Congestion Management Process, and the increased cost to purchase equipment.

Sierra Club and Earthjustice supported the use of a footprint-based attribute curve but criticized the use of separate curves for passenger cars and light trucks. The commenter reasoned that this delineation incentivizes the sale of more light trucks and has contributed to the automobile fleet including more inefficient light trucks than passenger cars. They recommended that NHTSA include a backstop

minimum standard to address this issue or at least model the impact of a mix shift backstop, stating that doing so will become increasingly important as EVs become more common.

Hyundai suggested that NHTSA consider the impacts on manufacturers, U.S. manufacturing, and customers if it is not practicable for the industry to reach production plans within the planned timeframes or under future proposed standards. The commenter encouraged NHTSA to include flexibilities and consider supply chain challenges and disruptions the industry faces when considering the range of alternatives and evaluating impacts.

### ***B.2.5.1 Technological and Economic Assumptions***

#### ***Technological Assumptions***

Two submissions addressed the technological assumptions used in NHTSA's CAFE Compliance Model (CAFE Model). For technology feasibility, Tesla suggested that NHTSA consider all technologies that are capable of being implemented in the relevant model years under consideration instead of limiting its consideration to technologies that are currently in commercial use. Further, the commenter recommended including an evaluation of advanced vehicle technologies, including potential levels of ZEV deployment resulting from any proposed alternative. Additionally, Tesla said that NHTSA should recognize that the increased ZEV adoption means that ICE vehicle sales have already peaked globally and are now declining.

The Sierra Club and Earthjustice commented that the U.S. Department of Energy (DOE) has not updated the petroleum equivalency factor for EVs since 2000, despite a statutory obligation to do so. If no new factor is available at the time of modeling, the commenter recommended that NHTSA should model the removal of a fuel content multiplier. The commenter stated that the fuel content multiplier is a factor without statutory support that can, in one example, increase the imputed fuel economy of a vehicle from 48 miles per gallon to 322 miles per gallon.

DOE published an NPRM on April 11, 2023, to revise its regulations regarding procedures for calculating a value for the petroleum-equivalent fuel economy of EVs for use in the CAFE program.<sup>6</sup> Technological and economic assumptions, including the petroleum equivalency factor, that NHTSA is using in developing its proposed CAFE standards are addressed in Section II.C of the NPRM and Chapter 9.2.5.4 of the PRIA.

#### ***EV Sales***

Three submissions addressed the economic assumptions surrounding projected EV sales that are included in NHTSA's CAFE Model. Rivian recommended that NHTSA reconsider its customer valuation of fuel economy technologies in terms of increased EV sales because, the commenter stated, consumers usually undervalue the accrued lifetime fuel savings. Further, they suggested that NHTSA conduct a new review of consumer behavior and valuation trends.

ZETA provided research stating that passenger EV sales will continue to increase. They also cited many analyses the commenter asserted show that EVs typically cost less over their lifetime and retain their

---

<sup>6</sup> Petroleum-Equivalent Fuel Economy Calculation; Notice of Proposed Rulemaking; Request for Comment, 88 FR 21525 (Apr. 11, 2023).

value longer despite a higher sticker price than gas-powered vehicles. Further, they stated that the lifetime cost of HD EVs is frequently lower than their gas-powered counterparts.

The Sierra Club and Earthjustice stated that NHTSA modeling must account for the IRA and IIJA in assessing maximum feasible standards. The commenter described several provisions of IRA and IIJA as facilitating the sale of EVs and provided a citation indicating that the IRA will reduce petroleum consumption by 13 percent by 2030.

In developing its regulatory baseline, NHTSA's CAFE and HDPUV No-Action Alternatives account for incentives included in the IIJA and IRA. Unlike other technologies in the analysis, Congress placed specific limitations on how NHTSA considers EV fuel economy when setting CAFE standards.<sup>7</sup> For the EIS analysis, NHTSA does consider manufacturers building EVs in response to the standards in order for NHTSA to consider the actual environmental impacts of the action in the decision-making process.<sup>8</sup> NHTSA discusses maximum feasible standards in the proposed rule preamble, Section IV.

### **B.2.5.2 Upstream Emissions**

The Sierra Club and Earthjustice recommended that NHTSA rely on updated emissions data for the electric grid and stated that commenters have, in the past, opposed NHTSA's use of old emissions data. Sierra Club and Earthjustice stated that inputs to the calculation—including the electrical energy efficiency of vehicles and the national average electricity generation and transmission efficiencies—are significantly out of date and in need of updating due to changes that have occurred in both vehicles and the national electric generation and transmission facilities during the past 22 years. Because of recent legislation, the commenter urged NHTSA to utilize projected improvements in grid emissions from U.S. Energy Information Administration's Annual Energy Outlook 2022 and DOE.

NHTSA's analysis includes electricity emission factors from AEO 2022. For more information, see Chapter 5 of the TSD.

### **B.2.5.3 Compliance**

Two commenters addressed the incentive and compliance flexibility components of NHTSA's standards. Hyundai warned of supply chain and raw mineral constraints limiting production and technological progress in the automotive industry, which the commenter said may limit compliance with the standards and require a greater need for flexibilities. Hyundai urged NHTSA to consider developing an optional program that provides credits or flexibilities to manufacturers who target higher fuel economy vehicle distribution in environmental justice communities, and suggested that such a program could be structured similarly to the current off-cycle credit program.

Sierra Club and Earthjustice opposed incentives for hybrid full-size pickup trucks on top of benefits offered by mild and strong hybrid technologies, asserting that these incentives have no real-world fuel economy benefits. They commented that manufacturers will produce electric and hybrid trucks even absent this incentive and urged NHTSA to model a scenario where these incentives are discontinued. Sierra Club and Earthjustice also opposed NHTSA increasing the cap of off-cycle credits to 15 gallons per

---

<sup>7</sup> 49 U.S.C. 32902(h)(1), (2). In determining maximum feasible fuel economy levels, "the Secretary of Transportation—(1) may not consider the fuel economy of dedicated automobiles; [and] (2) shall consider dual fueled automobiles to be operated only on gasoline or diesel fuel."

<sup>8</sup> 40 CFR 1500.1(a).

mile, stating that there is not sufficient data to support these credits and that emissions benefits are likely less than the sum of individual menu technologies. The commenter recommended that the program be restructured to provide guardrails and require manufacturers to provide comprehensive data to support real-world benefits of credit requests.

NHTSA considered these comments in the development of the proposal. These topics are discussed in Section VI of NHTSA's NPRM preamble.

### **B.2.6 Other Comments**

PA DOT expressed concern that any decrease in fuel consumption caused by NHTSA's action would cause fuel tax revenue decreases that would affect transportation funding. This commenter suggested that alternate transportation funding scenarios need to be considered as NHTSA's rulemaking moves forward.

An individual commenter suggested that NHTSA and EPA should ban all new ICE LD vehicles by 2035, citing Washington State, Canada, United Kingdom, Ireland, and European Union commitments to phase out ICE vehicles. The commenter also stated that, because of GHG impacts, biofuel must be banned, along with ICE vehicles generally and hybrid EVs. Furthermore, the commenter stated that ICE vehicles must be banned by 2038 in order to meet net-neutral emissions goals by 2050.

NHTSA discusses what factors it can consider in accordance with statutory responsibilities in the proposed rule preamble, Section IV.

# **APPENDIX C**

## **Air Quality**

## **APPENDIX C AIR QUALITY**

### **C.1 Introduction**

This appendix summarizes the criteria pollutants, toxics, vehicle standards, and conformity regulations that inform the affected environment for Chapter 4, *Air Quality*. Section C.2, *Health Effects of Criteria Pollutants*, Section C.3, *Health Effects of Mobile Source Air Toxics*, and Section C.4, *Vehicle Emissions Standards*, describe the environment and resource areas, including human health impacts, that are affected by NHTSA’s CAFE standards for MY 2027–2032 passenger cars and light trucks and fuel efficiency (FE) standards for MY 2030–2035 heavy-duty pickup trucks and vans (HDPUVs). Section C.5, *Methods*, describes the methodology used for assessing air quality impacts. Chapter 2, *Proposed Action and Alternatives and Analysis Methods*, describes the Proposed Action and alternatives used in this analysis for the CAFE and HDPUV FE standards.

### **C.2 Health Effects of Criteria Pollutants**

The following sections describe the health effects of the five criteria pollutants addressed in this EIS analysis. This information is adapted from EPA (2021c). The most recent EPA technical reports and *Federal Register* notices for National Ambient Air Quality Standards (NAAQS) reviews provide more information on the health effects of criteria pollutants (EPA 2020h, 2020i).

#### **C.2.1 Ozone**

Ozone is a photochemical oxidant and the major component of smog. Ozone is not emitted directly into the air but is formed through complex chemical reactions among precursor emissions of volatile organic compounds (VOCs) and nitrogen oxides (NO<sub>x</sub>) in the presence of the ultraviolet component of sunlight. Ground-level ozone causes health problems because it irritates the mucous membranes, damages lung tissue, reduces lung function, and sensitizes the lungs to other irritants. Ozone-related health effects also include respiratory symptoms and related effects, aggravation of asthma, increased hospital and emergency room visits, and increased asthma medication usage. Exposure to ozone for several hours at relatively low concentrations has been found to substantially reduce lung function and induce respiratory inflammation in normal, healthy people during exercise. There is also evidence that short-term exposure to ozone directly or indirectly contributes to premature and cardiopulmonary-related mortality.

In addition to its human health impacts, ozone has the potential to affect the health of vegetation and ecosystems. Ozone in the atmosphere is absorbed by plants and disturbs the plant’s carbon sequestration process, thereby limiting its available energy supply. Consequently, exposed plants can lose their vigor, become more susceptible to disease and other environmental stressors, and demonstrate reduced growth, visual abnormalities, or accelerated aging. According to the EPA Integrated Science Assessment (ISA) for Ozone and Related Photochemical Oxidants (EPA 2020j), ozone affects crops, vegetation, and ecosystems more than any other air pollutant. Ozone can produce both acute and chronic injury in sensitive species, depending on the concentration level, the duration of the exposure, and the plant species under exposure. Because of the differing sensitivities among plants to ozone, ozone pollution can also exert a selective pressure that leads to changes in plant community composition. Given the range of plant sensitivities and the fact that numerous other environmental factors modify plant uptake and response to ozone, it is not possible to identify threshold values above which ozone is consistently toxic for all plants.

VOCs, a chemical precursor to ozone, also can play a role in vegetation damage (National Park Service 2019). For some sensitive plants under exposure, VOCs have been demonstrated to affect seed production, photosynthetic efficiency, leaf water content, seed germination, flowering, and fruit ripening (Pinto et al. 2010). NO<sub>x</sub>, the other chemical precursor to ozone, has also been demonstrated to affect vegetation health (Hu et al. 2015; Viskari 2000; Ugrekhelidze et al. 1997; Kammerbauer et al. 1987; see comprehensive discussion in Appendix 3.3 of EPA 2020k). Most of the studies of the impacts of VOCs and NO<sub>x</sub> on vegetation have focused on short-term exposure; few studies have focused on long-term impacts and the potential for the metabolites<sup>1</sup> of these compounds to affect herbivores or insects.

## **C.2.2 Particulate Matter**

Particulate matter (PM) is a generic term for a broad class of chemically and physically diverse substances that exist as discrete particles. PM includes dust, dirt, soot, smoke, and liquid droplets directly emitted into the air, as well as particles formed in the atmosphere by condensation or by the transformation of emitted gases such as NO<sub>x</sub>, sulfur oxides (SO<sub>x</sub>), and VOCs. Fine particles are produced primarily by combustion processes and by these atmospheric transformations of emitted gases. The definition of PM also includes particles composed of elemental carbon (black carbon).<sup>2</sup> Gasoline-fueled and diesel-fueled vehicles emit PM. In general, the smaller the PM, the deeper it can penetrate into the respiratory system and the more damage it can cause. Depending on its size and composition, PM can damage lung tissue, aggravate existing respiratory and cardiovascular diseases, alter the body's defense systems against foreign materials, and cause cancer and premature death (EPA 2019b). PM with a diameter equal to or less than 2.5 microns (PM<sub>2.5</sub>) has been associated with risk for several respiratory conditions, including COVID-19 (Pozzer et al. 2020; Wu et al. 2020; Zhou et al. 2021). PM also can contribute to poor visibility by scattering and absorbing light, making the terrain appear hazy. To address visibility concerns, EPA developed the regional haze program,<sup>3</sup> which was put in place in July 1999 to protect visibility in Mandatory Class I Federal Areas (national parks and wilderness areas). EPA has also set secondary NAAQS to regulate non-Class I areas outside the regional haze program. Deposition of PM (especially secondary PM formed from NO<sub>x</sub> and SO<sub>x</sub>) can damage materials, adding to the effects of natural weathering processes by potentially promoting or accelerating the corrosion of metals, degrading paints, and deteriorating building materials (especially concrete and limestone).

EPA classifies diesel particulate matter (DPM) as a mobile source air toxic (MSAT), so it is addressed in Section C.3.5, *Diesel Particulate Matter*.

---

<sup>1</sup> Metabolites are formed as the initial compounds break down and are transformed through metabolism.

<sup>2</sup> Elemental carbon and black carbon are similar forms of fine PM and are considered synonymous for purposes of this analysis. The term *elemental carbon* describes carbonaceous particles based on chemical composition rather than light-absorbing characteristics. The term *black carbon* describes particles of mostly pure carbon that absorb solar radiation at all wavelengths (EPA 2012c). The carbon content of a sample of PM can be described by either term depending on the test method used: typically, the result for a sample tested by thermal or wet chemical methods is termed *elemental carbon* while the result for a sample tested by optical methods is termed *black carbon* (Long et al. 2013).

<sup>3</sup> Final Rule: Regional Haze Regulations, 64 FR 35714 (July 1, 1999).

### C.2.3 Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless, poisonous gas produced by incomplete combustion of carbon in fuels. Motor vehicles are the single largest source of CO emissions nationally.<sup>4</sup> When CO enters the bloodstream, it acts as an asphyxiant by reducing the delivery of oxygen to the body's organs and tissues. It can affect the central nervous system and impair the brain's ability to function properly. Health threats are most serious for those who suffer from cardiovascular disease, particularly those with angina or peripheral vascular disease. Epidemiological studies show associations between short-term CO exposure and cardiovascular morbidity, particularly increased emergency room visits and hospital admissions for coronary heart disease. Some epidemiological studies suggest a causal relationship between long-term exposures to CO and developmental effects and adverse health impacts at birth, such as decreased birth weight.

### C.2.4 Sulfur Dioxide

Sulfur dioxide (SO<sub>2</sub>), one of various oxides of sulfur, is a gas formed from combustion of fuels containing sulfur. Most SO<sub>2</sub> emissions are produced by stationary sources such as power plants. SO<sub>2</sub> is also formed when gasoline is extracted from crude oil in petroleum refineries and in other industrial processes. High concentrations of SO<sub>2</sub> cause severe respiratory distress (difficulty breathing), irritate the upper respiratory tract, and aggravate existing respiratory and cardiovascular disease. The immediate effect of SO<sub>2</sub> on the respiratory system in humans is bronchoconstriction (constriction of the airways). Asthmatics are more sensitive to the effects of SO<sub>2</sub>, likely because of preexisting bronchial inflammation. SO<sub>2</sub> also is a primary contributor to acidic deposition, or acid rain, which causes acidification of lakes and streams and can damage trees, crops, historic buildings, and statues.

### C.2.5 Nitrogen Dioxide

Nitrogen dioxide (NO<sub>2</sub>), a reddish-brown, highly reactive gas, is one of the oxides of nitrogen formed by high-temperature combustion (as in vehicle engines) of nitrogen and oxygen. Most NO<sub>x</sub> created in the combustion reaction consists of nitric oxide (NO), which oxidizes to NO<sub>2</sub> in the atmosphere. NO<sub>2</sub> can irritate the lungs and mucous membranes, aggravate asthma, cause bronchitis and pneumonia, and reduce resistance to respiratory infections. NO<sub>2</sub> has also been linked to other health outcomes, including all-cause (nonaccidental) mortality, hospital admissions or emergency department visits for cardiovascular disease, and reductions in lung function growth associated with chronic exposure. NO<sub>2</sub> from vehicle traffic has been associated with risk for several respiratory conditions, including COVID-19 (Lipsitt et al. 2021). Oxides of nitrogen are an important precursor to ozone and acid rain and can affect terrestrial and aquatic ecosystems.

## C.3 Health Effects of Mobile Source Air Toxics

The following sections briefly describe the health effects of the six priority MSATs analyzed in this EIS. This information is adapted from the EPA Regulatory Impact Analysis for the Revised 2023 and Later Model Year Light-Duty Vehicle GHG Emissions Standards (EPA 2021c).

---

<sup>4</sup> Highway motor vehicles overall accounted for approximately 30 percent of national CO emissions in 2021 (EPA 2022g). In 2023, passenger cars and passenger trucks are estimated to account for approximately 86 percent of the CO emissions from highway motor vehicles while HD pickup trucks and vans account for another 11 percent ("onroad\_2016fh 2016fj 2023fh 2023fj 2026fj.xlsx" file from EPA 2022h).

Motor vehicle emissions contribute to ambient levels of air toxics known or suspected to be human or animal carcinogens or known to have noncancer health effects. These compounds include, but are not limited to, acetaldehyde, acrolein, benzene, 1,3-butadiene, and formaldehyde. These five air toxics, plus DPM, are the six priority MSATs analyzed in this EIS. Most of these, except for DPM, were identified as national or regional risk drivers or contributors in the EPA 2018 and/or 2019 AirToxScreens and have significant inventory contributions from mobile sources (EPA 2022i). This EIS does not analyze polycyclic organic matter separately, but this matter can occur as a component of DPM and is discussed in Section C.3.5, *Diesel Particulate Matter*. Naphthalene also is not analyzed separately in this EIS, but it is a member of the polycyclic organic matter class of compounds discussed in Section C.3.5, *Diesel Particulate Matter*.

### **C.3.1 Acetaldehyde**

Acetaldehyde is classified in the EPA Integrated Risk Information System (IRIS) database as a probable human carcinogen, based on nasal tumors in rats, and is considered toxic by the inhalation, oral, and intravenous routes (EPA 1998). In its Fifteenth Report on Carcinogens (National Toxicology Program [NTP] 2021a), the U.S. Department of Health and Human Services “reasonably anticipates” acetaldehyde to be a human carcinogen, and the World Health Organization’s International Agency for Research on Cancer (IARC) classifies acetaldehyde as possibly carcinogenic to humans (Group 2B) (IARC 1999).

The primary noncancer effects of exposure to acetaldehyde vapors include eye, skin, and respiratory-tract irritation (EPA 1998, 2000b). In short-term (4-week) rat studies, degeneration of olfactory epithelium was observed at various concentration levels of acetaldehyde exposure (National Research Council Committee on Emergency and Continuous Exposure Guidance Levels for Selected Submarine Contaminants 2009). EPA used data from these studies to develop an inhalation reference concentration. Some asthmatics have been shown to be a sensitive subpopulation to decrements in functional expiratory volume and bronchoconstriction upon inhaling acetaldehyde (California Office of Environmental Health Hazard Assessment [OEHHA] 2014).

### **C.3.2 Acrolein**

Acrolein is extremely acrid and is irritating to humans when inhaled, with acute exposure resulting in upper respiratory tract irritation, mucus hypersecretion, and congestion. The intense irritancy of this carbonyl compound has been demonstrated during controlled tests in human subjects, who suffer intolerable eye and nasal mucosal sensory reactions within minutes of exposure (EPA 2003a). The EPA 2003 IRIS human health risk assessment for acrolein (EPA 2003a) summarizes these data and additional studies regarding acute effects of human exposure to acrolein. Evidence from studies in humans indicate that levels as low as 0.09 parts per million (ppm) (0.21 milligram per cubic meter) for 5 minutes can elicit subjective complaints of eye irritation, with increasing concentrations leading to more extensive eye, nose, and respiratory symptoms (OEHHA 2014). Lesions to the lungs and upper respiratory tracts of rats, rabbits, and hamsters have been observed after subchronic exposure to acrolein (OEHHA 2014). Animal studies report acute exposure effects such as bronchial hyper-responsiveness (OEHHA 2014). In a 2017 study, the acute respiratory irritant effects of exposure to 4 ppm acrolein were more pronounced in mice with allergic airway disease compared to nondiseased mice, which also showed decreases in respiratory rate (Snow et al. 2017). Based on these animal data and demonstration of similar effects in humans (e.g., reduction in respiratory rate), individuals with compromised respiratory function (e.g., emphysema and asthma) are expected to be at increased risk of developing adverse responses to strong respiratory irritants such as acrolein.

IARC determined that acrolein was classifiable as “probably carcinogenic” with respect to its carcinogenicity in humans (IARC 2020; Lancet 2021).

### C.3.3 Benzene

EPA’s IRIS database lists benzene as a known human carcinogen (causing leukemia) by all routes of exposure and concludes that exposure is associated with additional health impacts, including genetic changes in both humans and animals and increased proliferation of bone marrow cells in mice (EPA 2000c; IARC 2018). Data indicate a causal relationship between benzene exposure and acute lymphocytic leukemia and suggest a relationship between benzene exposure and chronic nonlymphocytic leukemia and chronic lymphocytic leukemia. IARC and the U.S. Department of Health and Human Services have characterized benzene as a human carcinogen (IARC 2018; NTP 2021b).

Several adverse noncancer health effects, including blood disorders such as preleukemia and aplastic anemia, have also been associated with long-term exposure to benzene (OEHHA 2014). The most sensitive noncancer effect observed in humans, based on current data, is depression of the absolute lymphocyte count in blood (OEHHA 2014; EPA 2003b). In addition, recent work, including studies sponsored by the Health Effects Institute (HEI), provides evidence that biochemical responses are occurring at lower levels of benzene exposure than previously known (OEHHA 2014).

### C.3.4 1,3-Butadiene

EPA has characterized 1,3-butadiene as carcinogenic to humans through inhalation (EPA 2002a, 2002b). IARC has determined that 1,3-butadiene is a probable human carcinogen, and the U.S. Department of Health and Human Services has characterized 1,3-butadiene as a known human carcinogen (IARC 2012; NTP 2021c). Numerous experiments have demonstrated that animals and humans metabolize 1,3-butadiene into compounds that are genotoxic (capable of causing damage to a cell’s genetic material such as deoxyribonucleic acid [DNA]). The specific mechanisms of 1,3-butadiene-induced carcinogenesis are not known; however, scientific evidence strongly suggests that the carcinogenic effects are mediated by genotoxic metabolites. Animal data suggest that females could be more sensitive than males to cancer effects associated with 1,3-butadiene exposure. There are insufficient data on humans from which to draw conclusions about sensitive subpopulations. 1,3-butadiene also causes a variety of reproductive and developmental effects in mice; there are no available human data on these effects. The most sensitive effect was ovarian atrophy observed in a lifetime bioassay of female mice (EPA 2002b).

### C.3.5 Diesel Particulate Matter

Diesel exhaust consists of a complex mixture of carbon dioxide (CO<sub>2</sub>), oxygen, nitrogen, water vapor, CO, nitrogen compounds, sulfur compounds, and numerous low-molecular-weight hydrocarbons. A number of these gaseous hydrocarbon components are individually known to be toxic, including aldehydes, benzene, and 1,3-butadiene. The DPM present in diesel exhaust consists mostly of fine particles (smaller than 2.5 microns), of which a significant fraction is ultrafine particles (smaller than 0.1 micron). These particles have a large surface area, which makes them an excellent medium for adsorbing organics, and their small size makes them highly respirable. Many of the organic compounds present in the gases and on the particles, such as polycyclic organic matter, are individually known to have mutagenic and carcinogenic properties.

DPM also includes elemental carbon (black carbon) particles emitted from diesel engines. EPA has not provided a special status, such as a NAAQS or other health-protective measure, for black carbon, but addresses black carbon in terms of PM<sub>2.5</sub> and DPM emissions.

Diesel exhaust varies significantly in chemical composition and particle sizes between different engine types (HD, light-duty [LD]), engine operating conditions (idle, acceleration, deceleration), and fuel formulations (high-/low-sulfur fuel). Also, there are emissions differences between on-road and nonroad engines because the nonroad engines are generally older technology. After being emitted from the engine exhaust, diesel exhaust undergoes dilution, as well as chemical and physical changes in the atmosphere. The lifetime for some of the compounds present in diesel exhaust ranges from hours to days.

In EPA's 2002 *Diesel Health Assessment Document* (Diesel HAD) (EPA 2002c), exposure to diesel exhaust was classified as likely to be carcinogenic to humans by inhalation from environmental exposures, in accordance with the revised draft 1996 to 1999 EPA cancer guidelines (EPA 1999). EPA published a review of diesel exhaust health effects in 2007 (Ris 2007). The assessment concluded that long-term inhalation exposure is likely to pose a lung cancer hazard to humans as inferred from epidemiologic and certain animal studies. A number of other agencies (National Institute for Occupational Safety and Health, IARC, World Health Organization, California EPA, and U.S. Department of Health and Human Services) have made similar hazard classifications.

Noncancer health effects of acute and chronic exposure to diesel exhaust emissions are also of concern. EPA derived a diesel exhaust reference concentration from consideration of four well-conducted chronic rat inhalation studies showing adverse pulmonary effects. The reference concentration is 5 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) for diesel exhaust measured as DPM. This reference concentration does not consider allergenic effects such as those associated with asthma or immunologic effects or the potential for cardiac effects. There was emerging evidence in 2002, discussed in the Diesel HAD, that exposure to diesel exhaust can exacerbate these effects, but the exposure-response data were lacking at that time to derive a reference concentration based on these then-emerging considerations. The EPA Diesel HAD states, "With [DPM] being a ubiquitous component of ambient PM, there is an uncertainty about the adequacy of the existing [diesel exhaust] non-cancer database to identify all of the pertinent [diesel exhaust]-caused non-cancer health hazards." The Diesel HAD also notes "that acute exposure to [diesel exhaust] has been associated with irritation of the eye, nose, and throat, respiratory symptoms (cough and phlegm), and neurophysiological symptoms such as headache, lightheadedness, nausea, vomiting, and numbness or tingling of the extremities." The Diesel HAD notes that the cancer and noncancer hazard conclusions applied to the general use of diesel engines then on the market and, as cleaner engines replace a substantial number of existing ones, the applicability of the conclusions would need to be reevaluated.

The Diesel HAD also briefly summarizes health effects associated with ambient PM and discusses EPA's then-annual PM<sub>2.5</sub> NAAQS of 15  $\mu\text{g}/\text{m}^3$ . In 2012, EPA revised the annual PM<sub>2.5</sub> NAAQS to 12  $\mu\text{g}/\text{m}^3$ . There is a large and extensive body of human data showing a wide spectrum of adverse health impacts associated with exposure to ambient PM, of which diesel exhaust is an important component. The PM<sub>2.5</sub> NAAQS is designed to provide protection from the noncancer health effects and premature mortality attributed to exposure to PM<sub>2.5</sub>. The contribution of diesel PM to total ambient PM varies in different regions of the country, within a region, and from one area to another. The contribution can be high in near-roadway environments, for example, or in other locations where diesel engine use is concentrated.

Since 2002, several new studies have continued to report increased lung cancer risk with occupational exposure to diesel exhaust from older engines. Of particular note since 2011, three new epidemiology studies have examined lung cancer in occupational populations; for example, in truck drivers, underground nonmetal miners, and other diesel-engine-related occupations (HEI 2015; Olsson et al. 2011). These studies reported increased risk of lung cancer with exposure to diesel exhaust with evidence of positive exposure-response relationships to varying degrees. These newer studies—along with others that have appeared in the scientific literature (e.g., Kim et al. 2018; Ilar et al. 2017)—add to the evidence EPA evaluated in the 2002 Diesel HAD and further reinforce the concern that diesel exhaust exposure likely poses a lung cancer hazard. The findings from these newer studies do not necessarily apply to newer technology diesel engines because the newer engines have large reductions in the emissions constituents compared to older-technology diesel engines.

In light of the growing body of scientific literature evaluating the health effects of exposure to diesel exhaust, in June 2012, IARC, a recognized international authority on the carcinogenic potential of chemicals and other agents, evaluated the full range of cancer-related health effects data for diesel-engine exhaust. IARC concluded that diesel exhaust should be regarded as “carcinogenic to humans” (IARC 2014; Silverman 2018). This designation was an update from its 1988 evaluation, which considered the evidence indicative of a “probable human carcinogen.”

### C.3.6 Formaldehyde

In 1991, EPA concluded that formaldehyde is a carcinogen based on nasal tumors in animal bioassays (EPA 1991). EPA developed an inhalation unit risk for cancer and a reference dose for oral noncancer effects and posted them in the IRIS database. Since that time, NTP and IARC have concluded that formaldehyde is a known human carcinogen (NTP 2021d; IARC 2012).

The conclusions by IARC and NTP reflect the results of epidemiologic research published since 1991, in combination with previous animal, human, and mechanistic evidence. Research by the National Cancer Institute reported an increased risk of nasopharyngeal (nose and throat) cancer and specific lymphohematopoietic (lymph and blood) malignancies among workers exposed to formaldehyde (National Cancer Institute 2011). A National Institute of Occupational Safety and Health study of garment workers also reported increased risk of death due to leukemia among workers exposed to formaldehyde. Extended follow-up of a cohort of British chemical workers did not report evidence of an increase in nasopharyngeal or lymphohematopoietic cancers, but a continuing statistically significant excess in lung cancers was reported (Checkoway et al. 2015). Workers exposed to formaldehyde in pathology laboratories have been observed to experience increased genetic damage and alterations to various lymphocytes (Costa et al. 2019). Finally, a study of embalmers reported formaldehyde exposures to be associated with an increased risk of myeloid (bone marrow cell) leukemia but not brain cancer (Hauptmann et al. 2009).

Other health effects of formaldehyde were reviewed by the Agency for Toxic Substances and Disease Registry (ATSDR) in 1999 (ATSDR 1999) and supplemented in 2010 (ATSDR 2010), by the NTP (NIH 2011), and by the World Health Organization (World Health Organization 2002). These organizations reviewed the literature concerning effects on the eyes and respiratory system, the primary point of contact for inhaled formaldehyde, including sensory irritation of eyes, and respiratory tract, pulmonary function, nasal histopathology, and immune system effects. In addition, research on reproductive and developmental effects and neurological effects were discussed along with several studies that suggest formaldehyde may increase the risk of asthma, particularly in young people. EPA released a draft

Toxicological Review of Formaldehyde Inhalation Assessment through the IRIS program for peer review by the National Research Council (NRC) and public comment in June 2010 (EPA 2010d). The draft assessment reviewed more recent research from animal and human studies on cancer and other health effects. The NRC released their review report in April 2011 (NRC 2011a). EPA's draft assessment, which addresses NRC recommendations, was suspended in 2018. The draft assessment was resumed in March 2021 (EPA 2021f). In April 2022, EPA publicly released the draft formaldehyde assessment for review and comment, and the assessment is currently undergoing an independent external scientific peer review (EPA 2022l).

## C.4 Vehicle Emissions Standards

EPA and the California Air Resources Board (CARB) have established criteria pollutant emissions standards for vehicles under the Federal Clean Air Act (CAA). EPA and CARB have tightened these emissions standards over time as more effective emissions-control technologies have become available.<sup>5</sup> These stricter standards for LD vehicles (i.e., passenger cars and light trucks) and for HD vehicles are responsible for the declines in total criteria pollutant emissions from motor vehicles, as discussed in Chapter 4, Section 4.1.1, *Relevant Pollutants and Standards*. The EPA Tier 2 Vehicle & Gasoline Sulfur Program, which went into effect in 2004, established the CAA emissions standards that applied to MY 2004–2016 passenger cars and light trucks (EPA 2000d). Under the Tier 2 standards, manufacturers of passenger cars and light trucks were required to meet stricter vehicle emissions limits than under the previous Tier 1 standards. By 2006, U.S. refiners and importers of gasoline were required under the Tier 2 standards to manufacture gasoline with an average sulfur level of 30 ppm, a 90 percent reduction from earlier sulfur levels. These fuels enable post-MY 2006 vehicles to use emissions-control technologies that reduce tailpipe emissions of NO<sub>x</sub> by 77 percent for passenger cars and by as much as 95 percent for pickup trucks, vans, and sport utility vehicles compared to 2003 levels. On April 28, 2014, EPA issued a Final Rule establishing Tier 3 motor vehicle emissions and fuel standards.<sup>6</sup> The Tier 3 vehicle standards reduce both tailpipe and evaporative emissions from passenger cars, LD trucks, medium-duty passenger vehicles, and HDPUVs. Starting in 2017, Tier 3 sets new vehicle emissions standards and lowers the sulfur content of gasoline to 10 ppm, considering the vehicle and its fuel as an integrated system. The Tier 3 program phases out the Tier 2 vehicle emissions standards and replaces them with Tier 3 standards, which are being phased in over MYs 2017–2025 and will remain constant thereafter at the MY 2025 levels. The Tier 3 program will require emissions reductions from new passenger cars and light trucks of approximately 80 percent for NO<sub>x</sub> and VOCs, 70 percent for PM, and 67 percent for SO<sub>2</sub>. The Tier 3 gasoline sulfur standard will make emissions-control systems more effective for both existing and new vehicles and will enable more stringent vehicle emissions standards

---

<sup>5</sup> CAA Section 177 (42 U.S.C. 7507) gives states the option to adopt California's emissions standards provided they are more stringent than the corresponding Federal standards; states that have done so sometimes are referred to as Section 177 states. In addition to California and Section 177 states' GHG emissions standards, discussed in Appendix E, Section E.4.2.4.3, *Other Past, Present, and Reasonably Foreseeable Future Actions, United States: Regional and State Actions*, California and Section 177 states have enacted more stringent criteria pollutant emissions standards for vehicles under the CAA. California's regulation of criteria pollutant emissions from motor vehicles dates back to the 1970s and was the precursor to Congress' grant of authority to California to regulate in Section 209 of the CAA, and to other states in Section 177 of the CAA.

<sup>6</sup> Control of Air Pollution from Motor Vehicles: Tier 3 Motor Vehicle Emission and Fuel Standards; Final Rule, 79 FR 23414 (April 28, 2014).

(EPA 2014d). EPA proposed Tier 4 criteria pollutant standards for MY 2027–2032 LD vehicles and HDPUVs in its recently published notice of proposed rulemaking.<sup>7</sup>

Figure C.4-1 illustrates current trends in travel and emissions from highway vehicles, not accounting for the impacts of the Proposed Action and alternatives (Chapter 4, Section 4.2, *Environmental Consequences*). Since 1970, aggregate emissions traditionally associated with vehicles have decreased substantially even as vehicle miles traveled (VMT) increased by approximately 173 percent from 1970 to 2014, as shown in Figure C.4-1. For example, NO<sub>x</sub> emissions, due mainly to light trucks and HD vehicles, decreased by 71 percent between 1970 and 2016, despite increases in VMT (EPA 2016c). More recent trends show that changes in VMT are having a smaller and smaller impact on emissions because of stricter EPA standards for vehicle emissions and the chemical composition of fuels, even with additional growth in VMT (Smith 2002). This general trend will continue, to a certain extent, under any of the action alternatives. MSAT emissions will likely decrease in the future because of a 2007 EPA rule (EPA 2007). This rule limited the benzene content of gasoline beginning in 2011. It also limited exhaust emissions of hydrocarbons (many VOCs and MSATs are hydrocarbons) from passenger cars and light trucks when they are operated at cold temperatures. The cold-temperature standard was phased in from 2010 through 2015. EPA projected that these controls will substantially reduce emissions of acetaldehyde, acrolein, benzene, 1,3-butadiene, and formaldehyde.

**Figure C.4-1. Vehicle Miles Traveled Compared to Vehicle Emissions<sup>a,b,c</sup>**

Notes:

<sup>a</sup> Because CO emissions are about 10 times higher than emissions of NO<sub>x</sub>, SO<sub>x</sub>, and VOCs and emissions of PM2.5 are about 10 times lower than emissions of NO<sub>x</sub>, SO<sub>x</sub>, and VOCs, the scales for CO and PM2.5 are proportionally adjusted to enable comparison of trends among pollutants.

<sup>7</sup> Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles; Proposed Rule, 88 FR 29184 (May 5, 2023).

<sup>b</sup> Apparent increases in NO<sub>x</sub> and PM<sub>2.5</sub> emissions in 2002 are due to a change in methods made by EPA in 2012 from the MOBILE6.2 model to the MOVES model to calculate emissions for years 2002 and later (EPA 2013d).

<sup>c</sup> The decrease in VMT in 2020 reflects the decreased amount of driving during the COVID-19 pandemic.

Sources: Davis and Boundy 2022; EPA 2022g

VMT = vehicle miles traveled; VOC = volatile organic compound; NO<sub>x</sub> = nitrogen oxides; CO = carbon monoxide;

PM<sub>2.5</sub> = particulate matter 2.5 microns or less in diameter; SO<sub>x</sub> = sulfur oxides

## **C.5 Methods**

This section describes the approaches and methods used to estimate the impacts of the Proposed Action and alternatives in the EIS.

### **C.5.1 Overview**

NHTSA uses the CAFE Compliance and Effects Modeling System (the CAFE Model) to estimate manufacturers' potential responses to new CAFE, CO<sub>2</sub>, and HDPUV FE standards and to estimate various impacts of those responses. DOT's Volpe National Transportation Systems Center develops, maintains, and applies the model for NHTSA. The basic design of the CAFE Model is as follows: the system first estimates how vehicle manufacturers might respond to a given regulatory scenario, and from that potential compliance solution, the system estimates what impact that response will have on fuel consumption, emissions, and economic externalities. NHTSA also uses EPA's Motor Vehicle Emissions Simulator (MOVES) model to estimate "downstream" (tailpipe exhaust) emission factors, and uses Argonne National Laboratory's Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET) model to estimate emissions rates from fuel production and distribution processes ("upstream emissions").

To analyze air quality and human health impacts, NHTSA used the CAFE Model to calculate the emissions of criteria pollutants and MSATs from passenger cars and light trucks that would occur under each CAFE standard alternative. Similarly, NHTSA calculated the emissions of criteria pollutants and MSATs from HDPUVs that would occur under each FE standard alternative. NHTSA then estimated the resulting changes in emissions under each action alternative by comparing emissions under that alternative to those under the relevant No-Action Alternative. The resulting changes in air quality and impacts on human health were assumed to be proportional to the changes in emissions projected to occur under each CAFE standard and HDPUV FE standard action alternative.

The air quality analysis accounted for manufacturers' projected responses to CAFE, HDPUV FE, and CO<sub>2</sub> standards (including agreements some manufacturers have reached with California for MYs 2021–2026), zero-emission vehicle mandates in place in California and most Section 177 states,<sup>8</sup> and NHTSA's estimates of future fuel prices, market demand for fuel economy, and the cost and efficacy of fuel-saving technologies. The analysis also accounted for market responses, including demand for new LD vehicles and HDPUVs, scrappage of used LD vehicles and HDPUVs, and demand for travel (i.e., VMT), accounting for the rebound effect. The resultant change in emissions under each CAFE and HDPUV alternative would be the sum of the following components.

- Decreases in upstream emissions that result from decreases in gasoline consumption and, therefore, lower volumes of fuel production and distribution.

---

<sup>8</sup> Section 177 states refers to the states that have adopted California's criteria pollutant and GHG emissions regulations under Section 177 of the CAA (42 U.S.C. 7507).

- Increases in upstream emissions that result from increases in electricity generation to power plug-in hybrid electric vehicles (PHEVs) and battery electric vehicles (BEVs).
- Increases in per-vehicle tailpipe emissions resulting from slight shifts in passenger car sales toward light trucks (because improving fuel economy produces larger fuel savings for light trucks than for passenger cars, and criteria pollutant and air toxic per-mile emission rates for light trucks are projected to remain higher than for passenger cars) and slightly greater reliance on older vehicles (which have higher per-mile emission rates than newer vehicles).
- Increases in emissions resulting from increased VMT due to the rebound effect.
- Decreases in downstream emissions resulting from increases in sales and use of PHEVs and BEVs.

As discussed in Chapter 2, *Proposed Action and Alternatives and Analysis Methods*, the air quality results presented in Chapter 4, *Air Quality*, including impacts on human health, are based on assumptions about the type and rate of emissions from the combustion of fossil fuels. In addition to tailpipe estimates from the Motor Vehicle Emission Simulator (MOVES3), this analysis accounts for upstream emissions from the extraction, production, and distribution of fuels, including contributions from the power plants that generate the electricity used to recharge electric vehicles (EVs) and from the production of the fuel burned in those power plants. Emissions and other environmental impacts from electricity production depend on the efficiency of the power plant and the mix of fuel sources used, sometimes referred to as the *grid mix*. In the United States, the current (2020) grid mix is composed of natural gas, coal, nuclear, hydroelectric, wind, other renewable energy sources, and oil. The largest sources of electricity are from natural gas (38 percent), followed by renewables (22 percent), nuclear (20 percent), and coal (19 percent) (EIA 2022k).

To estimate upstream emissions changes resulting from changes in downstream fuel consumption, the analysis uses emissions factors from the Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET) model (version 2022 developed by the U.S. Department of Energy, Argonne National Laboratory). Upstream emission factors for gasoline, diesel, flex fuel (E85), and electricity in grams per million British thermal units (MMBtu) were taken from the GREET model in 5-year increments beginning in 2020 and ending in 2050. NHTSA developed upstream emissions factors for air toxics that are consistent with EPA's National Emission Inventory and emissions factors from the MOVES3 model (EPA 2022a).<sup>9</sup> A spreadsheet model was developed to adjust upstream emissions factors to account for the imported share of petroleum.

The analysis presented throughout this EIS assumes that the future EV fleet would charge from a grid whose mix is uniform across the country. As with gasoline, diesel, and E85, emissions factors for electricity were calculated in 5-year increments from 2020 to 2050 in GREET to account for projected changes in the national grid mix. The GREET model contains information on the intensities (amount of pollutant emitted per unit of electrical energy generated) that extend to 2050. To project the U.S. average electricity-generating fuel mix, this rulemaking uses the Annual Energy Outlook 2022 forecast from the National Energy Modeling System, an energy-economy modeling system from the U.S. Department of Energy.<sup>10</sup>

---

<sup>9</sup> EPA's MOVES model, described in Chapter 2, Section 2.5.1, *Downstream Emissions*, estimates emissions based on a variety of inputs, including vehicle type and age, fuel type and quality, operating conditions, and vehicle characteristics.

<sup>10</sup> The Annual Energy Outlook is the annual energy consumption forecast produced by the U.S. Energy Information Administration.

## C.5.2 Regional Analysis

Over the course of the development of recent CAFE EISs (NHTSA 2010, 2012, 2020, 2022) and the medium- and heavy-duty FE standards Phase 1 and 2 EISs (NHTSA 2011, 2016b), NHTSA received comments requesting that the agency consider the regional air quality impacts of these programs. NHTSA has included the following information about regional air quality impacts of the Proposed Action and alternatives in response to such comments and because the agency believes that such an analysis provides valuable information for the decision-maker, state and local authorities, and the public. Performing this analysis does not affect the agency's conclusion that a general conformity determination is not required. While a truly local analysis (i.e., at the individual roadway level) is impractical for a nationwide EIS, NHTSA believes a regional emissions analysis still provides valuable information and is feasible for the scope of this analysis.

To assess regional differences in the impacts of the alternatives, NHTSA estimated net emissions changes for individual nonattainment and maintenance areas. The distribution of emissions is not uniform nationwide, and either increases or decreases in emissions can occur within individual nonattainment and maintenance areas. NHTSA focused on nonattainment and maintenance areas because air quality problems have been the greatest in these areas. NHTSA's assessment emphasized areas that are in nonattainment or maintenance for ozone or PM<sub>2.5</sub> because these are the criteria pollutant emissions from LD vehicles and HDPUVs that are of greatest concern to human health. At present, there are no CO or NO<sub>2</sub> nonattainment areas. There are many areas designated as being in nonattainment for SO<sub>2</sub> or PM 10 microns or less in diameter (PM<sub>10</sub>). There are also maintenance areas for CO, NO<sub>2</sub>, PM<sub>10</sub>, and SO<sub>2</sub>. NHTSA did not quantify PM<sub>10</sub> emissions separately from PM<sub>2.5</sub> because almost all the PM in the exhaust from LD vehicles and HDPUVs is PM<sub>2.5</sub>. Appendix D, *Air Quality Modelling and Health Impacts Assessment*, provides emissions estimates for all nonattainment and maintenance areas for all criteria pollutants (except lead, as explained in Chapter 4, Section 4.1.1, *Relevant Pollutants and Standards*). On-road motor vehicles are a minor contributor to SO<sub>2</sub> emissions (less than 0.5 percent of national emissions, as noted above) (EPA 2020b) and are unlikely to affect the attainment status of SO<sub>2</sub> nonattainment and maintenance areas.

NHTSA's emissions analysis is national and regional but does not attempt to address the specific geographic locations of changes in emissions within nonattainment and maintenance areas. For example, there is limited evidence that EV use is disproportionately greater in areas with the worst traffic congestion (Section 8.3.3.3 of NHTSA 2020). Because hybrid EVs and PHEVs have lower tailpipe emissions compared to conventionally fueled vehicles, and BEVs have no tailpipe emissions, greater EV use in these areas could suggest that tailpipe emissions in urban nonattainment areas would be less than the analysis estimates. However, because of the complication and uncertainties associated with these local variations, NHTSA's emissions analysis does not assume any variation by vehicle type or fuel in the geographic distribution of VMT. In addition, EV charging location and time affects emissions from power plants by changing the demand for electricity in the region where charging occurs, for the duration of charging (Section 3.2.2.2, *Region-Specific Electricity Grid Impacts*). NHTSA's emissions analysis does not assume any variation in EV charging by location or time.

Emissions changes due to the rebound effect would occur from LD vehicles and HDPUVs operating on entire regional roadway networks; any emissions changes due to the rebound effect would be distributed throughout a region's entire road network and at any specific location would be uniformly proportional to VMT changes at that location. At any one location within a regional network, the resulting change in emissions would be small compared to total emissions from all sources surrounding

that location (including existing emissions from traffic already using the road), so the localized impacts of the Proposed Action and alternatives on ambient concentrations and health impacts should also be small. The nationwide aggregated consequences of such small near-source impacts on ambient pollutant concentrations and health might be larger but are not feasible to quantify.

### C.5.3 Analysis Periods

Ground-level concentrations of criteria and toxic air pollutants generally respond quickly to changes in emissions rates. The longest averaging period for measuring whether ambient concentrations of a pollutant comply with the NAAQS is 1 year.<sup>11</sup> This air quality analysis considers emissions that would occur over annual periods, consistent with the NAAQS. To evaluate impacts on air quality, specific years must be selected for which emissions are estimated and impacts on air quality are calculated.

NHTSA selected calendar years that are meaningful for the timing of likely effects of the alternatives, as follows.

- **2035:** A near-term forecast year for passenger cars, light trucks, and HDPUVs; by 2035 manufacturers could be 3 years beyond a full response (MY 2032) to new CAFE standards and in the process of responding to the new FE standards for HDPUVs, with vehicles produced in MYs 2027 and beyond accounting for much of the on-road fleet's VMT.
- **2050:** A long-term forecast year; by 2050, vehicles produced in MYs 2027 and beyond will account for almost all of the on-road fleet's VMT, such that changes in year-over-year impacts would be determined primarily by VMT growth.

### C.5.4 Incomplete or Unavailable Information

Where information in this analysis is incomplete or unavailable, NHTSA relies on CEQ regulations regarding incomplete or unavailable information.<sup>12</sup> As noted throughout this methods section, the estimates of emissions rely on models and forecasts that contain numerous assumptions and data that are uncertain. Examples of areas in which information is uncertain (and therefore may be incomplete or unavailable) include future emissions rates, vehicle manufacturers' decisions about vehicle technology and design, the mix of vehicle types and model years in the LD and HDPUV fleets, VMT projections, emissions from fuel refining and distribution, the future composition of the grid mix, and economic factors. The degree of uncertainty increases as projections extend farther into the future.

To support the information in this EIS, NHTSA used the best available models and supporting data. The models used for the EIS were subjected to scientific review and were approved by the agencies that sponsored their development. Nonetheless, there are limitations to current modeling capabilities. For example, uncertainties can derive from model formulation (including numerical approximations and the definition of physical and chemical processes) and inaccuracies in the input data (e.g., emissions inventory estimates).

---

<sup>11</sup> Compliance with the ozone NAAQS is based on the average of the fourth highest daily maximum 8-hour concentration over a 3-year period; compliance with the 24-hour PM<sub>2.5</sub> NAAQS is based on the average of the daily 98th-percentile concentrations averaged over a 3-year period; compliance with the annual PM<sub>2.5</sub> NAAQS is based on the 3-year average of the weighted annual mean concentrations.

<sup>12</sup> 40 CFR 1502.21(b).

Additional limitations are associated with the estimates of health impacts. To approximate the health impacts associated with each alternative, NHTSA used screening-level estimates of health impacts in the form of cases per ton of criteria pollutant emissions change. Changes in emissions of toxic air pollutants should also result in health impacts, but scientific data that would support quantification and monetization of these impacts are not available.

### **C.5.5 Allocation of Exhaust Emissions to Nonattainment Areas<sup>13</sup>**

For each CAFE standard and HDPUV FE standard alternative, the CAFE Model provided national emissions estimates for each criteria air pollutant (or its chemical precursors) and MSAT. National emissions were allocated to the county level using VMT data for each county. EPA provided estimated passenger car, light truck, and HDPUV VMT data for all counties in the United States, consistent with EPA's National Emissions Inventory (NEI).<sup>14</sup> VMT data used in the NEI were estimated from traffic counts taken by counties and states on major roadways, and therefore are subject to some uncertainty. These EPA data were projected for 2032, the most representative year available in the EPA dataset. NHTSA used the estimates of county-level VMT from the NEI only to allocate nationwide total emissions to counties and not to calculate the county-level emissions directly. The estimates of nationwide total emissions are based on the national VMT data used in the CAFE Model.

NHTSA used the county-level VMT allocations, expressed as the fractions of national VMT that take place within each county, to derive the county-level emissions from the estimates of nationwide total emissions. Emissions for each nonattainment area were then derived by summing the emissions for the counties included in each nonattainment area. Many nonattainment areas comprise one or more counties, and because county-level emissions are aggregated for each nonattainment area, uncertainties in the county-level emissions estimates carry over to estimates of emissions within each nonattainment area. Over time, some counties will grow faster than others, and VMT growth rates will vary. EPA's estimate of county-level VMT allocation is constant over time, which introduces some uncertainty into the nonattainment-area-level VMT estimates for future years. Additional uncertainties that affect county-level exhaust emissions estimates arise from differences among counties or nonattainment areas in factors other than VMT, such as ambient temperatures, vehicle age distributions, vehicle speed distributions, vehicle inspection and maintenance programs, and fuel composition requirements. Because of these uncertainties, emissions in a particular nonattainment area may be overestimated or underestimated. The overall uncertainty increases as the projection period lengthens, such as for analysis year 2050 compared with analysis year 2035.

The geographic definitions of nonattainment and maintenance areas that NHTSA uses in this document came from the current *Green Book Nonattainment Areas for Criteria Pollutants* (EPA 2023e). For nonattainment areas that include portions of counties, NHTSA calculated the proportion of county population that falls within the nonattainment area boundary as a proxy for the proportion of county VMT within the nonattainment area boundary. Partial county boundaries were taken from geographic information system (GIS) files based on 2023 nonattainment area definitions. The population estimates utilized projections to the 2035 and 2050 analysis years at 1-kilometer resolution across the country (Gao 2020). This method assumes that per-capita VMT is constant in each county so that the proportion of countywide VMT in the partial county area reflects the proportion of total county population residing

---

<sup>13</sup> In Section C.5.5, *Allocation of Exhaust Emissions to Nonattainment Areas*, and Section C.5.6, *Allocation of Upstream Emissions to Nonattainment Areas*, the term *nonattainment* refers to both nonattainment areas and maintenance areas.

<sup>14</sup> The VMT data provided by EPA are based on data generated by the Federal Highway Administration.

in that same area. This technique for allocating VMT to partial counties involves some additional uncertainty because actual VMT per capita can vary according to the characteristics of land use and urban development. For example, VMT per capita can be lower than average in urban centers with mass transit, and higher than average in suburban and rural areas where people tend to drive more (Cook et al. 2006; Eno Center for Transportation 2019).

The method for allocation of emissions to nonattainment areas is the same for all geographic areas and pollutants. Table C.5.5-1 lists the current nonattainment and maintenance areas for ozone and PM2.5 and their status and general conformity threshold. Areas for ozone and PM2.5 are listed because these are the pollutants for which nonattainment areas encompass the largest human populations. For the complete list of nonattainment and maintenance areas for all pollutants and standards, see Appendix D, *Air Quality Modelling and Health Impacts Assessment*.

**Table C.5.5-1. Nonattainment and Maintenance Areas for Ozone and PM2.5**

Nonattainment/Maintenance Area	Pollutant	Status <sup>a</sup>	General Conformity Threshold <sup>b</sup>
Allegan County, MI	Ozone	Moderate	100

Notes:

<sup>a</sup> Pollutants for which the area is designated in nonattainment or maintenance as of February 2023. For nonattainment areas, the status given is the severity classification as defined in 40 CFR 51.1303. Classifications in order of increasing ozone concentration are Marginal, Moderate, Serious, Severe 15, Severe 17, and Extreme. Where an area is nonattainment for more than one standard for the same pollutant, the more restrictive severity classification is shown.

<sup>b</sup> Emissions thresholds in tons per year. In ozone nonattainment areas, the thresholds given are for the precursor pollutants VOC or NO<sub>x</sub>; in PM2.5 nonattainment areas the thresholds represent primary PM2.5. Where an area is nonattainment for more than one standard for the same pollutant, the lowest applicable threshold is shown. Source: 40 CFR 93.153. These thresholds are provided for information only; a general conformity determination is not required for NHTSA’s Proposed Action.

Source: EPA 2023e

NO<sub>x</sub> = nitrogen oxides; PM2.5 = particulate matter 2.5 microns or less in diameter; VOC = volatile organic compounds

### C.5.6 Allocation of Upstream Emissions to Nonattainment Areas

For liquid and gaseous fuels, upstream emissions are generated when fuels used by motor vehicles are produced, processed, and transported. Upstream emissions are typically divided into four categories: feedstock recovery; feedstock transportation; fuel refining; and fuel transportation, storage, and distribution (TS&D). Feedstock recovery refers to the extraction or production of fuel feedstocks—the materials (e.g., crude oil) that are the main inputs to the refining process. In the case of petroleum, this is the stage of crude-oil extraction. During the next stage, feedstock transportation, crude oil or other feedstocks are shipped to fuel refineries. Fuel refining refers to the processing of crude oil into gasoline and diesel fuel. Fuel refining is the largest source of upstream emissions of criteria pollutants.

Depending on the specific fuel and pollutant, fuel refining accounts for between 48 and 87 percent of all upstream emissions per unit of fuel produced and distributed (based on GREET version 2022).

Commonly, TS&D refers to the movement of gasoline and diesel from refineries to bulk terminals, storage at bulk terminals, and transportation of fuel from bulk terminals to retail outlets.<sup>15</sup> Emissions of pollutants at each stage are associated with expenditure of energy and with leakage or spillage and evaporation of fuel products. NHTSA has allocated upstream emissions to individual nonattainment areas to provide additional information in its regional air quality analysis to the decision-maker and the public, consistent with previous CAFE EISs (NHTSA 2010, 2012, 2020, 2022) and the heavy-duty fuel efficiency standards EISs (NHTSA 2011, 2016b). NHTSA made a number of assumptions for this analysis because of uncertainty over the accuracy of the allocation of upstream emissions. A similar analysis was performed for upstream emissions from electricity for transportation use, accounting for feedstock production and then electricity generation and transmission using a nationally representative grid mix.

<sup>15</sup> Emissions that occur while vehicles are being refueled at retail stations are included in estimates of emissions from vehicle operation.

To analyze the impacts of the alternatives on individual nonattainment areas, NHTSA allocated projected emissions data from the EPA 2016-based air quality modeling platform (EPA 2022h). These EPA data were projected for 2032, the most representative year available in the EPA dataset. NHTSA allocated changes in nationwide total emissions, for each of the four source categories separately, to individual nonattainment areas. The EPA modeling platform includes estimates of emissions of criteria and toxic pollutants by county and by source category. Because each of the four upstream emissions source categories represents a separate source category in the EPA modeling platform, it is possible to estimate the share of nationwide emissions from each category that occurs within each nonattainment area. This analysis assumes that the share of emissions from feedstock extraction and fuel refining allocated to each nonattainment area does not change over time, which means that emissions for these two source categories are assumed to change uniformly (in percentage terms) across that category nationwide as a result of each alternative.<sup>16</sup> This analysis also assumes that the share of emissions from feedstock and fuel TS&D allocated to each nonattainment area can change over time based on the population forecast for each area.

### C.5.7 Health Impacts

This section describes NHTSA's approach to providing quantitative estimates of adverse health impacts of conventional air pollutants associated with each CAFE standard and HDPUV FE standard alternative. In this analysis, NHTSA quantified the impacts on human health anticipated to result from the changes in pollutant emissions and related changes in human exposure to air pollutants under each alternative. NHTSA evaluated the changes to several health outcomes associated with criteria pollutant emissions. Table C.5.7-1 lists the health outcomes NHTSA quantified. This method estimates the health impacts of each alternative for each analysis year, expressed as the number of additional or avoided adverse health outcomes per year. Health outcomes are calculated for each primary pollutant (NO<sub>x</sub>, directly emitted PM<sub>2.5</sub>, and SO<sub>2</sub>) and expressed as adverse health outcomes increased per ton of increased emissions or as adverse health outcomes avoided per ton of reduced emissions. Each primary pollutant has a specific factor related to its quantifiable health impacts expressed as incidence of impacts per ton of emissions. The general approach to calculating the health outcomes associated with each alternative is to multiply these factors by the estimated annual change in emissions of that pollutant and to sum the results of these calculations for all pollutants. This calculation provides the total health impacts that would result under each CAFE standard and HDPUV FE standard alternative.

**Table C.5.7-1. Human Health and Welfare Impacts of PM<sub>2.5</sub>**

Impacts Quantified	Impacts Excluded from Quantification <sup>a</sup>
Adult premature mortality	Chronic bronchitis (age >26)
Infant mortality	Emergency room visits for cardiovascular effects
Acute bronchitis (age 8–12)	Strokes and cerebrovascular disease (age 50–79)
Hospital admissions: respiratory (all ages) and cardiovascular (age >26)	Other respiratory effects (e.g., pulmonary function, non-asthma emergency room visits, nonbronchitis chronic diseases, other ages and populations)
Emergency room visits for asthma	Cardiovascular effects other than those listed

<sup>16</sup> NHTSA incorporated the feedstock recovery and feedstock transportation stages in this EIS. Emissions from the feedstock recovery and feedstock transportation stages are small relative to total upstream and tailpipe emissions and do not have a substantial effect on the EIS results.

Impacts Quantified	Impacts Excluded from Quantification <sup>a</sup>
Nonfatal heart attacks (age >18)	Reproductive and developmental effects (e.g., low birth weight, preterm births)
Lower (age 7–14) and upper (age 9–11) respiratory symptoms	Cancer, mutagenicity, and genotoxicity effects
Minor restricted-activity days (age 18–65)	--
Lost work days (age 18–65)	--
Asthma exacerbations (asthmatics age 6–18)	--

Notes:

<sup>a</sup> EPA excluded these effects because of insufficient confidence in available data or methods, or because current evidence is only suggestive of causality or there are other significant concerns over the strength of the association.

Source: EPA 2018b. See this source for more information related to the affected ages included in the analysis.

PM2.5 = particulate matter 2.5 microns or less in diameter; EPA = U.S. Environmental Protection Agency

In calculating the health impacts of emissions increases, NHTSA estimated only the PM2.5-related human health impacts expected to result from increased population exposure to atmospheric concentrations of PM2.5. Two other pollutants—NO<sub>x</sub> and SO<sub>2</sub>—are included in the analysis as precursor emissions that contribute to PM2.5 not emitted directly from a source but instead are formed by chemical reactions in the atmosphere (secondary PM2.5). Increases in NO<sub>x</sub> and VOC emissions would also increase ozone formation and the health effects associated with ozone exposure, but there are no incidence-per-ton estimates for NO<sub>x</sub> and VOCs because of the complexity of the atmospheric air chemistry and nonlinearities associated with ozone formation. This analysis does not include any increases in health impacts resulting from greater population exposure to other criteria air pollutants and air toxics because there are not enough data available to quantify these impacts.

### C.5.7.1 Quantified Health Impacts

The incidence-per-ton factors represent the total human health benefits due to a suite of PM-related health impacts for each ton of emissions reduced. The factors are specific to an individual pollutant and source. The PM2.5 incidence-per-ton estimates apply to directly emitted PM2.5 or its precursors (NO<sub>x</sub> and SO<sub>2</sub>). NHTSA followed the incidence-per-ton technique used in EPA’s PM2.5 NAAQS Regulatory Impact Analysis (RIA) (EPA 2013a), Ozone NAAQS RIA (EPA 2010a), Portland Cement National Emission Standards for Hazardous Air Pollutants RIA (EPA 2010b), NO<sub>2</sub> NAAQS RIA (EPA 2010c), and most recently updated in *Estimating the Benefit per Ton of Reducing PM<sub>2.5</sub> Precursors from 17 Sectors* (EPA 2018b).<sup>17</sup> NHTSA included additional updates given in Wolfe et al. (2019). Updates from the 2006 PM NAAQS RIA in the 2012 PM2.5 NAAQS RIA include no longer assuming a concentration threshold in the concentration-response function for the PM2.5-related health effects; using incidence derived from a major cohort study of PM2.5; and baseline incidence rates for hospital admissions, emergency department visits, and asthma prevalence rates. Revised health endpoints, sensitivity analyses, and new morbidity studies were also included.

<sup>17</sup> EPA refers to this technique as the “benefit per ton” method for estimating the health benefits of reduced emissions, and NHTSA follows this terminology in this appendix. However, this technique applies equally to estimating the additional health outcomes from increased emissions.

Table C.5.7-1 lists the quantified PM<sub>2.5</sub>-related benefits captured in those benefit-per-ton estimates, and potential PM<sub>2.5</sub>-related benefits that were not quantified in this analysis. The benefits estimates use the concentration-response functions<sup>18</sup> as reported in the epidemiology literature.<sup>19</sup>

EPA developed national per-ton estimates for selected pollutants emitted through stationary and mobile activity (EPA 2018b; Wolfe et al. 2019). Because the per-ton values vary slightly between the two categories, the total health impacts were derived by multiplying the stationary per-ton estimates by total upstream emissions and the mobile per-ton estimates by total mobile emissions. NHTSA's estimate of PM<sub>2.5</sub> benefits is, therefore, based on the total direct PM<sub>2.5</sub> and PM<sub>2.5</sub>-related precursor emissions controlled by sector and multiplied by this per-ton value.

PM-related mortality reductions provide most of the benefit in each benefit-per-ton estimate. The following description of EPA's approach is adapted from the *Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards* (EPA 2021c). EPA bases its benefits analyses on peer-reviewed studies of air quality and health effects. EPA calculated the premature mortality-related effect coefficients that underlie the benefits-per-ton estimates from an epidemiology study that examined a large population cohort—the American Cancer Society (ACS) cohort (Krewski et al. 2009). Recently, EPA updated its approach to estimating the benefits of changes in PM<sub>2.5</sub> and ozone. These updates were based on information drawn from EPA's 2019 PM<sub>2.5</sub> and 2020 Ozone ISAs, which were reviewed by the Clean Air Science Advisory Committee and the public (EPA 2019b, 2020j). NHTSA used the same PM<sub>2.5</sub> benefit-per-ton estimates that were used in the *Final Supplemental Environmental Impact Statement for Model Year 2024–2026 Corporate Average Fuel Economy Standards* (NHTSA 2022), to ensure consistency between the values corresponding to different source sectors.<sup>20</sup> These benefit-per-ton estimates are based on the review of the EPA 2009 PM ISA and 2012 PM ISA Provisional Assessment and include a mortality risk estimate derived from the Krewski et al. (2009) analysis of the ACS cohort and nonfatal illnesses consistent with benefits analyses performed for the analysis of the final EPA Tier 3 Vehicle Rule, the final EPA 2012 PM NAAQS Revision, and the final EPA 2017–2025 LD Vehicle GHG Rule. NHTSA expects this interval in updating the benefit-per-ton estimates to have a minimal impact on total PM benefits, since the underlying mortality risk estimate based on the Krewski study is identical to an updated PM<sub>2.5</sub> mortality risk estimate derived from an expanded analysis of the same ACS cohort.

The benefits of mortality reductions do not occur in the year of analysis. Instead, EPA's method assumes that there is a cessation lag—that is, the benefits are distributed across 20 years following the year of exposure (the emissions analysis year). The benefits-per-ton estimates used in this analysis are based on the mortality health outcome factors given in Table C.5.7-1. The benefit-per-ton estimates are subject to several assumptions and uncertainties:

---

<sup>18</sup> Concentration-response functions measure the relationship between exposure to pollution as a cause and specific outcomes as an effect (e.g., the incremental number of hospitalizations that would result from exposure of a population to a specified concentration of an air pollutant over a specified period).

<sup>19</sup> The complete method for creating the benefit-per-ton estimates used in this analysis is provided in *Estimating the Benefit per Ton of Reducing PM<sub>2.5</sub> Precursors from 17 Sectors* (EPA 2018b) and Fann et al. (2009). Since the publication of Fann et al. (2009), EPA no longer assumes that there is a threshold in PM-related models of health impacts.

<sup>20</sup> NHTSA made minor adjustments in the benefit-per-ton estimates for the petroleum transportation sector and the fuel transportation, storage, and distribution sector (Table C.5.7-2b) to reflect updated transportation mode shares in GREET 2022 compared to GREET 2021.

- The benefit-per-ton estimates incorporate projections of key variables, including atmospheric conditions, source level emissions, population, health baselines, and incomes. These projections introduce some uncertainties to the benefit-per-ton estimates.
- The benefit-per-ton estimates do not reflect local variability in population density, meteorology, exposure, baseline health incidence rates, or other local factors that might lead to an overestimate or underestimate of the actual benefits of controlling fine particulates (PM<sub>2.5</sub>). Emissions changes and benefit-per-ton estimates alone are not a precise indication of local or regional air quality and health impacts because there could be localized impacts associated with the Proposed Action and alternatives. Because the atmospheric chemistry related to ambient concentrations of PM<sub>2.5</sub>, ozone, and air toxics is very complex, full-scale photochemical air quality modeling is necessary to control for local variability. Full-scale photochemical modeling provides the needed spatial and temporal detail to estimate changes in ambient levels of these pollutants and their associated impacts on human health and welfare. This modeling provides insight into the uncertainties associated with the use of benefit-per-ton estimates. NHTSA intends to conduct a photochemical modeling analysis for the Final EIS using the same methods as in the CAFE Final EISs (NHTSA 2010, 2012, 2020, 2022) and the HD FE Standards Phases 1 and 2 Final EISs (NHTSA 2011, 2016b). Using the same approach the agency used for the *Final Supplemental Environmental Impact Statement for Model Year 2024–2026 Corporate Average Fuel Economy Standards* (NHTSA 2022) photochemical analysis, NHTSA intends to conduct the photochemical modeling analysis for this EIS using a 12-kilometer (7.5-mile) by 12-kilometer grid cell size in accordance with EPA guidance (EPA 2018d), making use of the most recent EPA emissions information that is based on a 12-kilometer by 12-kilometer grid cell size.
- NHTSA assumed that all fine particles, regardless of their chemical composition, are equally potent in causing premature mortality. This is an important assumption, because PM<sub>2.5</sub> produced via transported precursors emitted from stationary sources might differ significantly from direct PM<sub>2.5</sub> released from diesel engines and other industrial sources. However, there are no clear scientific grounds to support estimating differential effects by particle type.
- NHTSA assumed that the health impact (concentration-response) function for fine particles is linear within the range of ambient concentrations under consideration. Therefore, the estimates include health benefits from reducing fine particles in areas with varied concentrations of PM<sub>2.5</sub>, including regions that are in attainment for the fine-particle standard and those that do not meet the standard, down to the lowest modeled concentrations.
- The following uncertainties, among others, are associated with the health impact functions. These uncertainties could underestimate or overestimate benefits.
  - Within-study variability (the precision with which a given study estimates the relationship between air quality changes and health impacts)
  - Across-study variation (different published studies of the same pollutant/health effect relationship typically do not report identical findings, and in some cases the differences are substantial)
  - Application of concentration-response functions nationwide (does not account for any relationship between region and health impact to the extent that there is such a relationship)
  - Extrapolation of impact functions across population (NHTSA assumed that certain health impact functions applied to age ranges broader than those considered in the original epidemiological study)

- NHTSA was unable to quantify several health-benefits categories because of limitations associated with using benefit-per-ton estimates, several of which could be substantial. Because NO<sub>x</sub> and VOCs are also precursors to ozone, reductions in NO<sub>x</sub> and VOC emissions would also reduce ozone formation and the health effects associated with ozone exposure. Unfortunately, there are no benefit-per-ton estimates because of the complexity of the atmospheric air chemistry and nonlinearities associated with ozone formation. The PM-related benefit-per-ton estimates also do not include any human welfare or ecological benefits because of limitations on the availability of data to quantify these impacts of pollutant emissions.

Because of these uncertainties, it is not possible to draw conclusions about whether the benefit-per-ton values are underestimated or overestimated. The RIA for the 2012 PM<sub>2.5</sub> NAAQS (EPA 2013a) provides more information about the overall uncertainty in the estimates of the benefits of reducing PM<sub>2.5</sub> emissions.

Tables C.5.7-2a–e list the incidence-per-short-ton estimates for PM-related health impacts (derived by the process described in this section). For the analysis of direct and indirect impacts (Chapter 4, Section 4.2, *Environmental Consequences*) NHTSA used the values shown here for 2030 (Section C.5.3, *Analysis Periods*) to estimate impacts in 2035 and 2050.

NO<sub>x</sub> = nitrogen oxides; PM2.5 = particulate matter 2.5 microns or less in diameter; SO<sub>x</sub> = sulfur oxides; HDPUV = heavy-duty pickup trucks and vans

The EPA incidence-per-ton estimates shown in Tables C.5.7-2a–e are national averages and account for effects of upstream and downstream emissions separately. However, they do not reflect localized variations in emissions, population characteristics, or exposure to pollutants. Most upstream emissions are released from elevated points (e.g., tall stacks at refineries and power plants) and disperse widely before reaching ground level. The population in a large geographic region could be affected, but pollutant concentrations generally would be relatively low at any one location. On the other hand, concentrations very near an upstream source that releases emissions at a relatively low elevation could be greater. The actual health impacts from human exposure at any particular location would vary with emissions, local meteorology and topography, and population characteristics.

Unlike most upstream emissions, downstream emissions occur across the roadway system and are released at or near ground level. Populations located near roadways could experience relatively greater pollutant levels because the short distance from the roadway allows less pollutant dispersion to occur. Populations located at greater distances from roadways would be larger than the populations near the roadways but would experience much lower pollutant levels. As with upstream emissions, the actual health effects from human exposure at any particular location would vary with emissions, local meteorology and topography, and population characteristics. Because of these variations, the actual change in health impacts per ton of emissions change could be larger or smaller at any particular location than the values in Tables C.5.7-2a–e.

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-2. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Particulate Matter (PM<sub>2.5</sub>), 2050**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-3. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Sulfur Oxides (SO<sub>2</sub>), 2035

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-4. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Sulfur Oxides (SO<sub>2</sub>), 2050**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-5. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Nitrogen Oxides (NO<sub>x</sub>), 2035

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-7. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Volatile Organic Compounds (VOCs), 2035

Nonattainment or Maintenance Area	NAAQS Pollutant (Standard)	Status, Severity Classification <sup>a</sup>	General Conformity Threshold <sup>b</sup>	Emission Changes by Alternative (tons per year) <sup>c</sup>

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: U.S. EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

## Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants;

<http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-19. Changes in Emissions from U.S. Passenger Cars and Light Trucks by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Diesel Particulate Matter (DPM), 2035**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-23. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Particulate Matter (PM<sub>2.5</sub>), 2035**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-24. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Particulate Matter (PM<sub>2.5</sub>), 2050**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-25. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Sulfur oxides (SO<sub>2</sub>), 2035

Notes:  
<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.  
<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.  
<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.  
 NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-26. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Sulfur oxides (SO<sub>2</sub>), 2050

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-27. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Nitrogen oxides (NO<sub>x</sub>), 2035

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-28. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Nitrogen oxides (NO<sub>x</sub>), 2050**

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-33. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Acetaldehyde, 2035

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

**Table D-34. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Acetaldehyde, 2050**

Nonattainment or Maintenance Area	NAAQS Pollutant (Standard)	Status, Severity Classification <sup>a</sup>	General Conformity Threshold <sup>b</sup>	Emission Changes by Alternative (tons per year) <sup>c</sup>

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Yuma, AZ	PM10 (1987 24-hour)	Nonattainment, Moderate	100	0	0.00	0.00	0.00

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-37. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—Benzene, 2035

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Notes:

<sup>a</sup> Nonattainment or maintenance status as of 1/31/2023. Source: EPA, The Green Book Nonattainment Areas for Criteria Pollutants; <http://www.epa.gov/airquality/greenbook/>. "--" indicates that no severity classification has been established for the NAAQS pollutant.

<sup>b</sup> Emissions thresholds in tons per year. Where the threshold differs by precursor pollutant, the smallest of the precursor thresholds is shown. These thresholds are provided for information only; a general conformity determination is not required for the Proposed Action. Source: 40 CFR 93.853.

<sup>c</sup> Positive values are emissions increases; negative values are emissions decreases.

NAAQS = National Ambient Air Quality Standard; CFR = Code of Federal Regulations; CO = carbon monoxide; NO<sub>2</sub> = nitrogen dioxide; PM2.5 = particulate matter less than 2.5 microns in size; PM10 = particulate matter less than 10 microns in size; SO<sub>2</sub> = sulfur dioxide

Table D-39. Changes in Emissions from U.S. Heavy-Duty Pickup Trucks and Vans by Nonattainment or Maintenance Area and Alternative, Direct and Indirect Impacts—1,3-Butadiene, 2035
